

HANFORD SITE SOLID WASTE ACCEPTANCE CRITERIA
HNF-EP-0063, Revision 13

CONTENTS

| | |
|---|------|
| 1.0 INTRODUCTION | 1-1 |
| 1.1 PURPOSE AND SCOPE | 1-1 |
| 1.2 ROADMAP TO THE WASTE ACCEPTANCE CRITERIA | 1-2 |
| 1.3 WASTE ACCEPTANCE PROCESS | 1-3 |
| 1.4 GENERATOR RESPONSIBILITIES | 1-3 |
| 1.4.1 Waste Certification Program | 1-3 |
| 1.4.2 Quality Assurance Program | 1-3 |
| 1.4.3 Waste Minimization Program | 1-4 |
| 1.4.4 Waste Forecast | 1-4 |
| 1.5 EVALUATION OF GENERATOR WASTE CERTIFICATION PROGRAM | 1-4 |
| 1.6 EXCEPTIONS TO THE WASTE ACCEPTANCE CRITERIA | 1-5 |
| 1.6.1 WSD Project-Approved Exceptions | 1-5 |
| 1.6.2 DOE-Approved Exceptions | 1-5 |
| 1.6.3 Regulatory Agency-Approved Exceptions | 1-6 |
| 1.7 PRECEDENCE OF REQUIREMENTS | 1-6 |
| 2.0 GENERAL REQUIREMENTS | 2-1 |
| 2.1 GENERAL RADIOACTIVE CLASSES OF WASTE MANAGED AT HANFORD SITE TSD UNITS | 2-1 |
| 2.2 COMPOSITION OF WASTE AND CONTAINERS | 2-1 |
| 2.3 PROHIBITED WASTE | 2-1 |
| 2.4 PHYSICAL AND CHEMICAL CHARACTERIZATION | 2-2 |
| 2.4.1 Types of Acceptable Knowledge | 2-2 |
| 2.4.2 General Waste Knowledge Requirements | 2-3 |
| 2.4.3 Land Disposal Restrictions Waste Knowledge | 2-3 |
| 2.4.4 Exceptions to Physical and Chemical Characterization Requirements | 2-4 |
| 2.4.5 Recertification | 2-4 |
| 2.5 RADIOLOGICAL CHARACTERIZATION | 2-4 |
| 2.5.1 Identification of Major Radionuclides | 2-5 |
| 2.5.2 Methods for Establishing Radionuclide Inventory | 2-5 |
| 2.5.3 Additional Detail on Mobile Radionuclide Characterization | 2-7 |
| 2.5.4 Recertification | 2-7 |
| 2.5.5 Radioactive Material Shipments Less Than Values Specified in 49 CFR 173.436 or Derived According to 49 CFR 173.433 | 2-7 |
| 2.6 WASTE SEGREGATION AND TREATMENT AND/OR DISPOSAL PATH | 2-8 |
| 2.6.1 Segregation of Uncontaminated Waste from Radioactive Waste | 2-8 |
| 2.6.2 Radiological Release of Waste | 2-8 |
| 2.6.3 Segregation for Treatment, Storage, and/or Disposal | 2-9 |
| 2.6.4 Waste Streams Having No Established Treatment/Disposal Path | 2-9 |
| 2.6.5 Low-Level Mixed Waste From Non-PHMC Generators | 2-9 |
| 2.7 MANAGEMENT AND CERTIFICATION OF TRANSURANIC WASTE | 2-9 |
| 2.8 RECORDS | 2-10 |
| 2.9 CLASSIFIED AND ACCOUNTABLE NUCLEAR MATERIAL | 2-10 |
| 2.10 WASTE VERIFICATION | 2-10 |

DEFINITIONS

Acceptable knowledge. Characterization information collected by a generator to meet waste management requirements and determined to be adequate by the treatment, storage and/or disposal (TSD) unit.

Asbestos-containing waste material. Mill tailings or any waste that contains commercial asbestos and is generated by a source subject to Title 40, *Code of Federal Regulations* (CFR) 61 Subpart M. This term includes filters from control devices, friable asbestos waste material, and bags or other similar packaging contaminated with commercial asbestos. As applied to demolition and renovation operations, this term also includes regulated asbestos-containing material waste and waste materials contaminated with asbestos including disposable equipment and clothing. (40 CFR 61.141)

Bulk waste. Waste that is not containerized for disposal and contains potentially dispersible radiological contamination, such as soil and rubble.

Byproduct material. (1) Any radioactive material (except special nuclear material) yielded in or made radioactive by exposure to the radiation incident to the process of producing or utilizing special nuclear material, and (2) the tailings or wastes produced by the extraction or concentration of uranium or thorium from any ore processed primarily for its source material content. (DOE M 435.1-1)

Chelating agent. Amine polycarboxylic acids (e.g., Ethylenediamine Tetraacetic Acid, Diethylenetriaminepentaacetic Acid), hydroxy-carboxylic acids, and polycarboxylic acids (e.g., citric acid, carboxylic acid, and glucinic acid). (10 CFR 61.2)

Class IV oxidizer. An oxidizer that can undergo an explosive reaction due to contamination or exposure to thermal or physical shock. In addition, the oxidizer will enhance the burning rate and could cause spontaneous ignition of combustible materials. (UFC 1997)

Combustible waste. Any waste that does not meet the definition of non-combustible waste.

Contact handled. Packaged waste whose external surface dose rate does not exceed 2 milliSieverts per hour (200 millirem per hour) per hour, except that packages larger than 208 liters (55 gallons) could have a marked point on the bottom or side with a surface dose rate up to 10 milliSieverts per hour (1,000 millirem per hour).

Container. Any portable device in which a material is stored, transported, treated, disposed, or otherwise handled. (*Washington Administration Code* [WAC] 173-303-040)

Corrosive material. (Class 8) means a liquid or solid that causes full thickness destruction of human skin at the site of contact within a specified period of time. A liquid that has a severe corrosion rate on steel or aluminum based on the criteria in 49 CFR 173.137(c)(2) is also a corrosive material. (49 CFR 173.136)

Corrosive waste. A dangerous waste that exhibits the characteristic of corrosivity defined in WAC 173-303-090(6).

Dangerous waste. Solid waste designated in WAC 173-303-070 through -100 as dangerous or extremely hazardous waste, or mixed waste. (WAC 173-303-040)

Dangerous waste constituents. Those constituents listed in WAC 173-303-9905 and any other constituents that have caused a waste to be a dangerous waste under WAC 173-303.

Decontamination. The removal of radioactive material from facilities, equipment, or soils by washing, heating, chemical or electrochemical action, mechanical cleaning, or other techniques.

Disposal facility. The land, structures, and equipment comprising a facility at which hazardous waste is intentionally placed into or on any land or water, and at which waste will remain after closure.

Dose equivalent curie (DE-Ci). A method of normalizing the radiotoxicity of various radionuclides to plutonium-239 for use in establishing that operations remain within approved safety bases at certain Hanford Site waste management units. The normalization is based on the relative committed effective dose equivalent from inhalation of each radionuclide to that of plutonium-239 using the conversion factors from the International Commission of Radiological Protection (ICRP) Publication 71, “Age-dependent doses to members of the public from intake of radionuclides: Part 4, Inhalation dose coefficients.”

U.S. Environmental Protection Agency (EPA) hazardous waste numbers. The number assigned by the EPA to each hazardous waste listed in 40 CFR 261, Subpart D, and to each characteristic identified in 40 CFR 261, Subpart C.

Explosive waste. A waste that meets the definition of WAC 173-303-090 (7)(a)(vi), (vii) or (viii).

Extremely hazardous waste. Dangerous waste and mixed waste designated in WAC 173-303-100 as extremely hazardous. (WAC 173-303-040)

Facility. All contiguous land, structures, other appurtenances, and improvements on the land, used for recycling, reusing, reclaiming, transferring, treating, storing, or disposing of dangerous waste. The Hanford facility consists of several treatment, storage, or disposal operational units (e.g., one or more landfills, surface impoundments, or combinations of these). (WAC 173 303-040)

Fissile material. Material made up of radionuclides that will sustain a chain reaction by thermal (slow) neutron induced fission. For the Hanford Site criticality safety program, uranium-233, uranium-235, plutonium-239, and plutonium-241 are the primary radionuclides of interest.

Fissionable materials. Substances containing radionuclides capable of sustaining a nuclear fission chain reaction (regardless of neutron energy). Such material could be fissionable only by

nature of its form, configuration or environment. This includes, but is not limited to, uranium-233, uranium-235, plutonium-238, plutonium-239, plutonium-240, plutonium-241, neptunium-237, americium-241, and curium-244.

Flammable liquid. A liquid having a flash point of not more than 60.5 degrees Celsius (141 Fahrenheit), or any material in a liquid phase with a flash point at or above 37.8 Celsius (100 degrees Fahrenheit) that is intentionally heated and offered for transportation at or above its flash point in a bulk packaging. (49 CFR 173)

Flammable solid. Any of the following types of materials: wetted explosives, self-reactive materials that are liable to undergo a strongly exothermal decomposition caused by excessively high temperatures or contamination, or readily combustible solids that might cause a fire through friction. (49 CFR 173)

Free liquids. Those liquids determined to be present in a waste as defined by the *Paint Filter Liquids Test, Method 9095 of Test Methods for Evaluating Solid Waste, Physical/Chemical Methods* (SW-846).

Generator. Any person, by site, whose act or process produces radioactive or mixed waste or whose act first causes a waste to become subject to regulation under WAC 173-303. The term generator also includes any person or organization that manages a dangerous waste at the generating site on behalf of the generator.

Gross weight. The tare weight of a container plus the weight of its contents.

Hanford Site Treatment, Storage, and/or Disposal Unit or Hanford Site TSD Unit. Any one of the operational treatment, storage, or disposal units having acceptance criteria defined by this document. This specifically excludes all other TSD units identified on the Hanford Site.

Hazardous waste. Solid waste designated by 40 CFR 261 and regulated as a hazardous waste and/or mixed waste by the EPA.

High-level waste. The highly radioactive waste material resulting from the reprocessing of spent nuclear fuel, including liquid waste produced directly in reprocessing and any solid material derived from such liquid waste that contains fission products in sufficient concentrations; and other highly radioactive material that is determined, consistent with existing law, to require permanent isolation. (DOE M 435.1-1)

Ignitable waste. A dangerous waste that exhibits the characteristic of ignitability as described in WAC 173-303-090(5).

Incompatible waste. A dangerous waste that is unsuitable for placement in a particular device or facility because it might corrode or decay the containment materials or is unsuitable for mixing with another waste or material because the mixture might produce heat or pressure, fire or explosion, violent reaction, toxic dusts, fumes, mists, or gases, or flammable fumes or gases. (WAC 173-303-040)

Infectious waste. Any waste that contains or is suspected to contain pathogenic microorganisms infectious to humans, including: cultures and stocks of infectious agents, human blood and body fluids, contaminated animal carcasses, body parts, bedding exposed to infectious agents, and human pathological waste. Waste that has been treated by heat (e.g., incineration, autoclaving) or chemical disinfectants to destroy pathogenic organisms is not considered infectious waste.

Inner liner. A continuous layer of material placed inside a tank or container that protects the construction materials of the tank or container from the contained waste or reagents used to treat the waste. (WAC 173-303-040)

Lab pack. A packaging method where a number of inner containers of waste are packaged into an outer drum as specified in 49 CFR 173.12(b). For this document, the term also could be used for U.S. Department of Transportation (DOT) Class 7 materials packaged in the same manner.

Land disposal restrictions. The restrictions and requirements for land disposal of hazardous or dangerous waste as specified in 40 CFR 268 and WAC 173-303-140. (Refer to definitions for *Resource Conservation and Recovery Act of 1976* [RCRA] Land Disposal Restrictions and Washington State Land Disposal Restrictions.)

Low-level mixed waste. Waste that meets both the definition of low-level waste and mixed waste.

Low-level waste. Radioactive waste that is not high-level radioactive waste, spent nuclear fuel, transuranic waste, byproduct material (as defined in section 11e.(2) of the *Atomic Energy Act of 1954* (42 USC 2011 et seq.), or naturally occurring radioactive material. (DOE M 435.1-1)

Mixed waste. A dangerous, extremely hazardous, or acutely hazardous waste that contains both a nonradioactive hazardous component and, as defined by 10 CFR 20.1003, source, special nuclear, or by-product material subject to the *Atomic Energy Act of 1954* (42 USC 2011 et seq.). (WAC 173-303-040)

Major radionuclides. Those radionuclides in a waste that contribute significantly to the overall hazards of the waste, including criticality and human exposure by various pathways, as the waste is managed.

Mobile radionuclides. Radionuclides that tend to migrate readily through Hanford soil and pose the highest risk of impact to groundwater resources: tritium (hydrogen-3), carbon-14, chlorine-36, selenium-79, molybdenum-93, technetium-99, iodine-129, rhenium-187, uranium (all isotopes), and neptunium-237.

Non-biodegradable sorbent. A sorbent material meeting the requirements of 40 CFR 264.314(e).

Noncombustible waste. Containerized waste that shows no evidence of combustion or decomposition on exposure to 538 degrees Celsius (1,000 degrees Fahrenheit) for 10 minutes as

specified by NUREG-0782, or waste that has been stabilized by grouting or disposal in a high-integrity container (HIC).

Organic peroxide. Any organic compound containing oxygen (O) in the bivalent -O-O- structure and that might be considered a derivative of hydrogen peroxide, where one or more of the hydrogen atoms have been replaced by organic radicals.

Onsite. Any property within the Hanford Site boundary. (NOTE: DOT, *Comprehensive Environmental Response, Compensation and Liability Act of 1980* [CERCLA], and RCRA regulations have varying definitions of onsite; the precise DOT, CERCLA, and RCRA meanings of the term are not implied in the use of the term in this document.)

Operational safety requirements or technical safety requirements. Those requirements that define the conditions, safe boundaries, and bases thereof and the management or administrative controls required to ensure the safe operation of a nuclear facility.

Organic liquid. A chemical compound having carbon-carbon chemical bonds and that is a liquid at standard temperature and pressure. Typical organic liquids include organic solvents, petroleum oils, and synthetic oils.

Outer packaging. The outermost enclosure of a composite or combination packaging together with any absorbent materials, cushioning, and any other components necessary to contain and protect inner receptacles or inner packagings. (49 CFR 171)

Performance assessment. An analysis of a radioactive waste disposal facility conducted to demonstrate there is a reasonable expectation that performance objectives established for the long-term protection of the public and the environment will not be exceeded following closure of the facility. (DOE M 435.1-1)

Project Hanford Management Contract. The current contract with the U.S. Department of Energy to operate portions of the Hanford Site, including the facilities described in this document. Fluor Hanford, Inc. is the Project Hanford Management Contract contractor.

Plutonium-equivalent curie (PE-Ci). A method of normalizing the radiotoxicity in transuranic waste to plutonium-239 for use in establishing the approved safety limits at the Waste Isolation Pilot Plant (WIPP) located near Carlsbad, New Mexico. The normalization is based on the relative committed effective dose equivalent from inhalation of a radionuclide to that of plutonium-239 using the conversion factors from DOE/EH-0071, "Internal Dose Conversion Factors for Calculation of Dose to the Public," as described in Appendix B of DOE/WIPP-02-3122.

Plutonium-239 fissile gram equivalent. A method of normalizing fissile and fissionable isotopes to plutonium-239 for use in establishing criticality safety limits for the Hanford Site Solid Waste Program. This is consistent with the method found in the safety analysis reports for the transuranic package transporter-II and 72-B casks for plutonium-239, uranium-233, and uranium-235 and in ANSI/ANS 8.15 for other fissile, fissionable, and special actinide elements.

Polychlorinated biphenyl (PCB). Any chemical substance that is limited to the biphenyl molecule that has been chlorinated to varying degrees or any combination of substances that contains such substance (40 CFR 761.3).

Process knowledge. Knowledge the generator applies to a solid waste to determine if it is a dangerous or mixed waste in light of the materials or the processes used, when such knowledge can be demonstrated to be sufficient for determining whether a solid waste is designated properly. Process knowledge includes information on waste obtained from existing published or documented waste analysis data or studies conducted on mixed waste from processes similar to that which generated the waste. Process knowledge for mixed waste also could include information obtained from surrogate material.

Pyrophoric material. A liquid or solid that, even in small quantities and without an external ignition source, can ignite within 5 minutes after coming in contact with air when tested as specified by 49 CFR 173.124.

Qualified analytical data. Data from waste analysis that is not fully compliant with an approved sampling and/or analysis method (e.g., where quality assurance/quality control deficiencies were identified from the sampling and/or analysis of the waste).

Radioactive waste. Any garbage, refuse, sludges, and other discarded material, including solid, liquid, semisolid, or contained gaseous material that must be managed for its radioactive content. (DOE M 435.1-1)

RCRA land disposal restrictions. The requirements and restrictions for land disposal of hazardous waste codified in 40 CFR 268.

Reactive waste. A dangerous waste that exhibits the characteristic of reactivity as described in WAC 173-303-090(7).

Remote handled. Packaged waste whose external surface dose rate exceeds the limits for contact-handled waste.

Remote-handled transuranic waste. Packaged transuranic waste whose unshielded payload container external surface dose rate exceeds 2 milliSieverts per hour (200 millirem per hour), unless the shielding is part of a Waste Isolation Pilot Plant approved pipe overpack configuration.

Secular equilibrium. Equilibrium that occurs between a parent radionuclide and daughter radionuclide where the half-life of the parent is significantly longer than the daughter.

Shock-sensitive waste. Reactive waste meeting the definition of WAC 173-303-090(7)(a)(vii) (waste is readily capable of detonation or explosive composition or reaction at standard temperature and pressure).

Solidification. Any technique that reduces the solubility and mobility of dangerous waste constituents and/or radionuclides by physical means rather than by bonding or chemically reacting with the stabilizing material.

Sorb. To absorb or adsorb.

Sorbent. A material used to soak up free liquids by either adsorption or absorption, or both.

Specific activity. The radiological activity (disintegrations per unit of time) of a radionuclide per unit mass of that radionuclide. The specific activity of a material in which the radionuclide is essentially uniformly distributed is the radiological activity per unit mass of the material.

Spent nuclear fuel. Fuel that has been withdrawn from a nuclear reactor following irradiation, the constituent elements of which have not been separated by reprocessing. Test specimens of fissionable material irradiated for research and development only, and not production of power or plutonium, may be classified as waste, and managed in accordance with the requirements of DOE 435.1 when it is technically infeasible, cost prohibitive, or would increase worker exposure to separate the remaining test specimens from other contaminated material. (DOE M 435.1-1)

Spontaneously combustible material. A pyrophoric or self-heating material. (49 CFR 171)

Stabilization. Any technique that reduces the solubility and mobility of dangerous waste constituents and/or radionuclides by bonding or chemically reacting with the stabilizing material. The term stabilization to meet land disposal restrictions (LDR) is used when the specific definition of 40 CFR 268.42, Table 1, is implied.

Standard waste box. A payload container authorized for use with TRUPACT-II transportation packages for packaging of transuranic waste (NRC 1996).

State-only dangerous waste. Any waste that is regulated as a dangerous waste under WAC 173-303 but is not regulated as a hazardous waste under 40 CFR 261. (WAC 173-303-040)

Storage. The holding of radioactive waste for a temporary period, at the end of which the waste is treated, disposed of, or stored elsewhere. (DOE M 435.1-1)

Toxic. Having the properties to cause or to significantly contribute to death, injury, or illness of humans or wildlife. (WAC 173-303-040)

Toxic Substances Control Act of 1976 PCB waste. Any PCB-containing waste that is regulated under the TSCA requirements codified in 40 CFR 761.

Transuranic mixed waste, or TRU-mixed waste. Waste that meets both the definitions of transuranic waste and mixed waste.

Transuranic waste. Radioactive waste containing more than 100 nanocuries (3700 becquerels) of alpha-emitting transuranic isotopes per gram of waste, with half-lives greater than 20 years, except for: (1) high-level radioactive waste; (2) waste that the Secretary of Energy has determined, with the concurrence of the Administrator of the U.S. Environmental Protection Agency, does not need the degree of isolation required by the 40 CFR Part 191 disposal regulations; or (3) waste that the Nuclear Regulatory Commission has approved for disposal on a case-by-case basis in accordance with 10 CFR 61 (DOE M 435.1-1).

Treatment. The physical, chemical, or biological processing of dangerous waste to make such waste nondangerous or less dangerous, safer for transport, amenable for energy or material resource recovery, amenable for storage, or reduced in volume, with the exception of compacting, repackaging, and sorting as allowed under WAC 173-303-400(2) and 173-303-600(3). (WAC 173-303-040)

Treatment, storage, and/or disposal unit manager or TSD unit manager. The individual, or delegate, having responsibility for the operation of a given TSD unit within the limits of the TSD unit RCRA Permit, safety basis, performance assessment, and/or other environmental requirements.

U.S. Department of Energy, Richland Operations Office (RL). The field element of the U.S. Department of Energy that is responsible for the storage and disposal facilities listed in this document.

Washington State Land Disposal Restrictions or Washington State LDR. The land disposal restrictions of WAC 173-303-140(4).

Washington State-Only Dangerous Waste. State-only dangerous waste.

Waste Specification Record. A document that identifies the anticipated treatment, storage, and/or disposal methods to be applied to a given class of waste managed at Hanford Site TSD units.

Waste stream. A waste or group of wastes from a process or a facility with similar physical, chemical, or radiological properties. (DOE M 435.1-1)

Water-reactive waste. Waste that meets the definition of WAC 173-303-090(7)(a)(ii), (iii) or (iv).

Waste Stabilization and Disposition (WSD) Project acceptance organization. The organization within the Waste Stabilization and Disposition Project that is responsible for waste acceptance, including approval of waste stream profiles and approval of individual waste packages and shipments, and for coordinating the approval of case-by-case evaluations for specific criteria and exceptions to the acceptance criteria.

1.0 INTRODUCTION

U.S. Department of Energy (DOE) Order 435.1, *Radioactive Waste Management*, requires that each treatment, storage, and/or disposal facility (referred to in this document as a treatment, storage and/or disposal [TSD] unit) that manages low-level or transuranic (TRU) waste (including mixed waste and *Toxic Substances Control Act of 1976* [TSCA] polychlorinated biphenyl [PCB] waste) maintain waste acceptance criteria. This requirement is implemented through DOE/RL-2000-25, *Contracts Requirement Document 435.1, Radioactive Waste Management Plan*. The waste acceptance criteria for U.S. Department of Energy, Richland Operations Office (RL) TSD units are provided, including criteria for the Low-Level Burial Grounds (LLBG), the Central Waste Complex (CWC), the T Plant, and the Waste Receiving and Processing (WRAP) Facility.

1.1 PURPOSE AND SCOPE

The criteria for each TSD unit are established in this document to ensure that waste accepted can be managed within the operating requirements of the unit, including, but not limited to, environmental regulations, DOE Orders, permits, technical safety requirements (HNF-11724, Section 9.1; HNF-15280, Section 5.6.12), waste analysis plans, and performance assessments. The requirements of DOE O 435.1 and DOE M 435.1-1 are implemented through DOE/RL-2000-25. Revisions to the acceptance criteria document require an Unreviewed Safety Question review to document that the changes are consistent with current applicable safety analyses.

Acceptance criteria apply to the following RL TSD units.

- The lined trenches in the LLBG
- The CWC
- The WRAP Facility
- The T Plant Complex

Waste from all generators, including Hanford Site and offsite facilities, must comply with these criteria. Exceptions can be granted as provided in Section 1.6.

Specific waste streams could have additional requirements based on the identified TSD pathway. These requirements are communicated in the waste specification records (WSRd) and/or waste stream profile sheet approvals.

The Hanford Site manages nonradioactive waste through direct shipments to offsite contractors. The waste acceptance requirements of the offsite TSD facility must be met for these nonradioactive wastes. This document does not address the acceptance requirements of these offsite facilities.

Selection of specific storage locations and container movements within a TSD unit are outside the scope of these acceptance criteria.

1.2 ROADMAP TO THE WASTE ACCEPTANCE CRITERIA

Chapter 1.0 provides introductory information and describes general administrative requirements that apply to generators.

Chapter 2.0 identifies requirements that generally apply to waste sent to any of the TSD units. These criteria relate primarily to overall characterization and segregation methods used by generators. In addition, acceptance criteria that are the same for all units are provided in this chapter.

Chapters 3.0 through 6.0 communicate the unit-based criteria for acceptance of waste. Each of these chapters contains a general description of the unit functions followed by identification of prohibited waste, physical/chemical acceptance criteria, radiological acceptance criteria, and packaging criteria. These TSD units and the general functions follow.

- Chapter 3.0: The lined trench portion (trenches 31 and 34) of the 218-W-5 Burial Ground is a *Resource Conservation and Recovery Act of 1976* (RCRA-) permitted disposal unit for certain mixed waste and low-level waste that meets federal and state land disposal restrictions (LDR). The unit may also dispose of certain types of TSCA polychlorinated biphenyl (PCB) waste.
- Chapter 4.0: The CWC is a storage unit for low-level mixed waste, low-level TSCA PCB waste, TRU waste, TRU mixed waste, TRU TSCA PCB waste, and other waste types that must be stored pending treatment and/or disposal.
- Chapter 5.0: The T Plant Complex is a multipurpose unit for storage, repackaging, treatment, and decontamination of radioactive waste. The T Plant Complex can accept low-level and TRU waste, including mixed and TSCA PCB waste.
- Chapter 6.0: The WRAP is a multipurpose unit for processing and treating low-level and TRU waste, including mixed and TSCA PCB waste. The WRAP can perform nondestructive assay (NDA) and nondestructive examination (NDE) of waste containers. The WRAP is the primary unit for repackaging and processing TRU waste for certification for disposal at the Waste Isolation Pilot Plant (WIPP).

Chapter 7.0 lists references for all chapters except the appendices. Each appendix has its own reference section.

Appendix A provides radiological calculation methods.

Appendix B provides fissionable material content limits.

Appendix C describes labeling of containers.

Appendix D describes selection of containers, coatings, and liners.

Appendix E describes selection of sorbents, stabilizing materials, and void fillers.

Appendix F, “Radiological Release of Waste,” has been retired.

Appendix G provides contact-handled TRU waste acceptance criteria and certification requirements.

Appendix H provides a listing of approved vents.

Appendix I provides remote-handled TRU waste acceptance criteria

1.3 WASTE ACCEPTANCE PROCESS

The process for obtaining approval to ship waste to the Hanford Site Waste Stabilization and Disposition (WSD) Project’s TSD units is described on the *Hanford Site Solid Waste Acceptance Program* Internet web site (<http://www.hanford.gov/wastemgt/wac/acceptprocess.cfm>). Use of the waste acceptance process is mandatory.

All non-Hanford Site waste generators must receive approval from the RL before acceptance and shipment of waste to Hanford Site TSD units.

1.4 GENERATOR RESPONSIBILITIES

Generators of radioactive waste have certain general responsibilities under DOE O 435.1. Acceptance of waste at Hanford Site TSD units is contingent on effectively fulfilling these responsibilities.

1.4.1 Waste Certification Program

Generators must implement and maintain a waste certification program to ensure that any waste sent to a Hanford Site TSD unit meets the acceptance criteria of that unit (Sections III.J. and IV.J of DOE M 435.1-1). Generators are responsible financially for costs incurred by Hanford Site TSD units as a result of nonconformance with the acceptance criteria. All non-conforming containers can be returned to the generator for resolution. There is no obligation for WSD Project TSD units to correct generator nonconformances.

1.4.2 Quality Assurance Program

Each generator shall have a Quality Assurance Program (QAP) as part of its overall waste certification program. The QAP shall implement the requirements of Title 10 *Code of Federal Regulations* (CFR) 830, “Subpart A—Quality Assurance Requirements,” and DOE O 414.1C

(DOE M 435.1-1). The generator QAP shall be subject to evaluation according to the requirements of Section 1.5.

1.4.3 Waste Minimization Program

Generators shall establish and maintain an auditable waste minimization program, including goals, incentives, procedures, and reports, to ensure that the amount of radioactive waste generated and/or shipped for disposal is minimized (DOE M 435.1-1). For Hanford Site generators, the most current version of DOE/RL-91-31 defines the methods for meeting this requirement.

1.4.4 Waste Forecast

Generators that wish to ship waste to the Hanford Site TSD unit shall provide an annual waste forecast. This input is done through the Solid Waste Integrated Forecast Technical (SWIFT) tool. Integration of this data is summarized in the SWIFT Report and provides up-to-date life cycle information about radioactive solid waste expected to be managed by Hanford's Waste Stabilization and Disposition WSD Organization from onsite and offsite generators. The data contained in this report are the official data for solid waste forecasting. Request to update this forecast is sent out semi-annually, in conjunction with the budget cycle.

The SWIFT report contains two volumes. Volume I provides strictly waste metrics in several forms; (e.g., volume, containers, radionuclides, etc.). Volume II gives detailed history and analyzes any changes to the metrics.

Customized data reports or analyses may be requested by contacting Ms. Roberta Barcot:

E-mail: Roberta_A_Barcot@rl.gov

Phone: (509) 373-4752

This report and more information is also available at the following website address:

<http://www.hanford.gov/swift>.

1.5 EVALUATION OF GENERATOR WASTE CERTIFICATION PROGRAM

Under DOE M 435.1-1, receiving TSD units must evaluate waste to ensure the waste meets the acceptance criteria of the unit. This requirement is implemented through review of information submitted by the generator and verification and confirmation inspections performed on waste containers. When repeated or serious nonconformances are found, additional evaluations will be performed as defined in the waste analysis plan for that TSD unit. When necessary, an onsite audit of the waste certification program of the generator, including applicable portions of the QAP, will be required.

1.6 EXCEPTIONS TO THE WASTE ACCEPTANCE CRITERIA

Exceptions to these acceptance criteria may be granted in certain cases. The process to obtain approval of an exception is determined by the source and type of the requirements from which the specific acceptance criterion is derived. These requirements fall into three categories, each having a specific approval process, as described in the following sections.

A generator can request an exception from one or more of the criteria in this document. The request should be a written letter to the WSD Project acceptance organization. The request must identify the specific requirement(s) in this document for which an exception is desired, the reason an exception is needed, and any proposed alternative methods to meet the general intent of the requirement.

The WSD Project acceptance organization will review the exception request and determine the appropriate category and approval process, based on the background documentation for these acceptance criteria. This documentation identifies the source(s) of each requirement so a determination can be made whether an exception could be approved by the WSD Project acceptance organization, or whether RL and/or regulatory agency approvals are required. On completion of this review, the WSD Project acceptance organization will respond in writing, identifying whether the exception is granted, rejected, or requires further evaluation or clarification.

1.6.1 WSD Project-Approved Exceptions

An exception to these acceptance criteria can be granted when the WSD Project acceptance organization demonstrates that the exception does not affect compliance with (1) any applicable regulations and (2) any RL and/or regulatory agency-approved requirements. For example, a TSD unit's container size limits are operational requirements not related to any regulation or externally-approved document. If a larger container could be managed at that TSD unit with special handling provisions, the WSD Project acceptance organization can grant an exception to the container size requirement.

The WSD Project acceptance organization, in conjunction with the TSD operations organization, documents and certifies that the exception being granted does not affect compliance with any applicable regulations or any of the externally-approved requirements of the TSD units.

1.6.2 DOE-Approved Exceptions

Exceptions to acceptance criteria that could affect compliance with DOE-approved requirements documents (e.g., safety basis, performance assessment) or DOE Orders will require a RL waiver, RL approval of a safety document revision, or other RL approval. For this type of exception, the appropriate waiver request, document revision, or other applicable request for approval will be submitted by Fluor Hanford, Inc. to the RL.

1.6.3 Regulatory Agency-Approved Exceptions

Exceptions to acceptance criteria that could affect compliance with regulations, permit conditions, compliance orders, or other requirements imposed by a regulatory agency must be submitted by the RL to the affected regulatory agency(ies).

1.7 PRECEDENCE OF REQUIREMENTS

Cases might arise where two or more similar requirements or limits occur in the acceptance criteria. All requirements and limits must be met. If it appears that one requirement or limit is less restrictive than others, the more restrictive one must be met.

2.0 GENERAL REQUIREMENTS

Certain general requirements apply to acceptance of all waste at Hanford Site TSD units. These requirements are described as follows.

2.1 GENERAL RADIOACTIVE CLASSES OF WASTE MANAGED AT HANFORD SITE TSD UNITS

The TSD units covered by these acceptance criteria manage low-level and TRU waste. This generally excludes acceptance of waste classified as high-level waste, spent nuclear fuel, and/or byproduct material.

2.2 COMPOSITION OF WASTE AND CONTAINERS

For all waste, a detailed record must be kept of the contents, volume, and weight, as well as any added void fillers, sorbents, stabilization agents, or solidification agents (DOE M 435.1-1).

For containerized waste, the container type, weight, internal and external volume, any shielding provided, and the date packaged must be recorded (DOE M 435.1-1). In the case of labpacks, the record shall include the exact number, type, and volume of inner containers.

2.3 PROHIBITED WASTE

The following waste types are not accepted.

- Dangerous waste not having dangerous waste numbers listed on the TSD unit's approved Part A, Form 3, permit application (DOE/RL-88-21).
- Explosive waste (HNF-5841, HNF-21239).
- Shock sensitive waste (HNF-1886, HNF-2165, HNF-5841, HNF-9921, HNF-21239).
- Pyrophoric waste (HNF-1886, HNF-2165, HNF-5841, HNF-9921).
- Class IV oxidizer (see definitions) waste (HNF-1886, HNF-2165, HNF-5841, HNF-9921, HNF-21239).
- Waste that is readily capable of detonation, explosive decomposition, reaction at anticipated pressures and temperatures, or explosive reaction with water. Prior to storage, pyrophoric materials shall be treated, prepared, and packaged to be nonflammable (DOE M 435.1-1, Chapters III and IV, N.1).

- Containers packaged such that toxic air pollutants exceed small quantity emission rates in *Washington Administrative Code* (WAC) 173-460.
- Infectious waste.

2.4 PHYSICAL AND CHEMICAL CHARACTERIZATION

The waste generator must determine the physical and chemical characteristics of the waste with sufficient accuracy and detail to properly designate and manage the waste in accordance with the unit-specific acceptance criteria and all applicable regulations (i.e., knowledge) (e.g., HNF-5841, HNF-9921, HNF-1886, HNF-2165, 40 CFR 264.13, WAC 173-303-300, 40 CFR 761).

The following sections describe the physical/chemical characterization requirements for waste acceptance.

2.4.1 Types of Knowledge

The types of information that can be used for physical/chemical characterization include data from analysis of the waste and knowledge of the materials and/or processes that generate the waste. Knowledge can be obtained using the following types of information.

- Analysis data from a representative sample of the waste or for a waste generated by a similar process.
- Test data from a nonradioactive surrogate sample that is chemically representative of a radioactive waste stream.
- Material Safety Data Sheets for commercial chemical products.
- Mass balance data for the waste generating process, to the extent that such data provides a sufficient understanding of the characteristics of and constituents in the waste stream.
- Interview information.
- Logbooks.
- Procurement records.
- Qualified analytical data.
- Radiation work packages.
- Procedures and/or methods.
- Process flow charts.

- Inventory sheets.
- Vendor information.

The following sections describe how this information may be used to meet the knowledge requirements and when analysis of a representative sample is required.

2.4.2 General Waste Knowledge Requirements

General waste knowledge must be sufficient to determine the waste stream designation and to manage the waste in accordance with TSD unit-specific acceptance criteria necessary for proper management of the waste.

Analytical data and/or knowledge of the waste must be sufficient to determine whether the waste is regulated under 40 CFR 261, or 40 CFR 761, and/or WAC 173-303, and to assign correct waste numbers. Knowledge of the waste generating process alone is used to determine whether a waste stream is a listed waste identified in WAC 173-303-080 through WAC-173-303-082. For other waste numbers and for classification under 40 CFR 761, if the available process knowledge is not sufficient to determine whether the waste is regulated and to assign waste numbers, analysis of a representative sample must be performed. The sampling and testing methods outlined in WAC 173-303-110 must be used for the toxicity characteristics, corrosivity, and free liquids. For other characteristic and state criteria designations, when testing is needed, an appropriate method must be used. Appropriate test methods can include SW-846 test methods or any other methods with proper quality assurance and quality control.

In cases where one or more constituents are input into a process, but are not expected to be in the waste in concentrations that would cause the waste to be regulated, and when process knowledge is questionable, sampling and analysis should be performed to demonstrate that the constituents are below regulated limits. This analysis could be met through chemical screening and considered process knowledge.

NOTE: If sampling and analysis were performed, it would only be needed for initial characterization of a consistent waste stream.

All waste must be characterized in a manner sufficient to ensure that the waste can be managed in accordance with the unit-specific waste management requirements set forth in this document. This includes (but is not limited to) sufficient knowledge to demonstrate that the waste is not prohibited from management at that unit, to segregate waste containers for compatibility, to ensure compatibility of waste with containers, to ensure that the waste can be safely managed, and to segregate waste for treatment, storage and/or disposal in accordance with the WSRds.

2.4.3 Land Disposal Restrictions Waste Knowledge

For waste that is a hazardous waste as defined in 40 CFR 261, waste characterization must be sufficient to establish whether the waste is a restricted waste under the LDR provisions of 40 CFR 268 and, if so, to determine the applicable LDR subcategories and treatment standard(s) for that waste. Testing of a representative sample at a Hanford Site laboratory or another independent laboratory is required when a generator or treatment facility certifies that a waste stream meets a concentration-based treatment standard of 40 CFR 268. To certify that a waste stream meets a specified technology treatment standard in 40 CFR 268, the generator or treatment facility must provide data; i.e., an LDR certification form that demonstrates that the waste was properly treated by that treatment technology.

In addition, for waste that is a dangerous waste as defined in WAC 173-303, characterization must be sufficient to establish which, if any, of the Washington State LDR requirements of WAC 173-303-140 apply.

2.4.4 Exceptions to Physical and Chemical Characterization Requirements

The following exceptions can be made to the physical/chemical characterization requirements stated previously.

- Hazardous debris that is managed in accordance with the alternative treatment standards for hazardous debris (40 CFR 268.45) does not require sampling and analysis for adequate physical/chemical characterization.
- Hanford Site generators can transfer waste for storage at an onsite TSD unit without full characterization for designation and LDR status, provided the characterization is sufficient to demonstrate that the waste can be managed in accordance with the unit-specific acceptance criteria and provided a representative sample (or samples) has been obtained or will be obtained at the TSD unit to fully characterize the waste.
- An alternative management path negotiated by the RL with the appropriate regulatory agency can characterize waste that cannot be characterized in accordance with the requirements stated previously because of factors such as unique chemical or radiological hazards of the waste. This type of exception will be handled by the method outlined in Section 1.6.3.

2.4.5 Recertification

Physical/chemical characterization data for a waste stream must be recertified annually, and whenever the waste generating process changes. Recertification shall, at a minimum, identify changes to the generating process and any additional analytical data obtained from the waste stream. Sampling and analysis of the waste stream is not required to be performed more frequently than required by the receiving TSD unit's waste analysis plan.

2.5 RADIOLOGICAL CHARACTERIZATION

The major radionuclides in the waste and the concentration of each major radionuclide must be established with sufficient sensitivity and accuracy to properly classify and manage the waste in accordance with the TSD unit-specific radiological limits (DOE M 435.1-1).

2.5.1 Identification of Major Radionuclides

For the purposes of the radiological criteria in this document, major radionuclides are defined as those radionuclides that meet any of the following conditions. Calculational methods for determining these limits are described in Appendix A.

- Any TRU radionuclide present in the waste in concentration exceeding 1 nanocurie per gram.
- Any fissionable radionuclide present in the waste in a quantity exceeding 0.1 fissile gram equivalent per container.
- Any radionuclide present in concentration exceeding 1 percent of its respective Category 1 limit (Appendix A, Table A-2).

NOTE: This reporting limit does not apply to TRU waste.

- Any mobile radionuclide present in concentration that exceeds its reporting limit (Appendix A, Table A-2).

NOTE: This reporting limit does not apply to TRU waste.

- For waste that has no detectable radiological activity but cannot be radiologically released, major radionuclides are those radionuclides believed to contribute more than 1 percent each to the radiological activity based on available process knowledge. The estimated concentration of the radionuclides should be based on the limit of detection of the analysis method used.
- The amount of uranium-235 and uranium-238 in each waste container must be reported if there is at least 0.1 gram of uranium-235 in the container, or if either isotope is a major radionuclide. The amount of uranium-233 in each waste container must be reported if it contains at least 0.1 gram of uranium-233.
- Any radionuclide that accounts for more than 1 percent of the total radiological activity of the waste must be reported. However, a radionuclide in concentration less than 1.0 E-6 curie per cubic meter, and not otherwise reportable, is exempt from reporting.

2.5.2 Methods for Establishing Radionuclide Inventory

The radionuclide inventory of a waste must be established using a method or combination of methods capable of identifying and quantifying the major radionuclides present. The methods

chosen must provide adequate sensitivity and accuracy to ensure that the waste is categorized correctly (e.g., Category 1 and 3 limits for the LLBG, correct TRU determination). A graded approach (DOE M 435.1-1) should be applied when planning radiological characterization of waste streams. Using the graded approach, more frequent and detailed analysis is performed when a waste approaches one or more of the limits of these criteria. Conversely, waste that is far below applicable limits of these criteria would not require as extensive or frequent analysis. Use of the data quality objectives process (or an equivalent process) in accordance with DOE M 435.1-1, should help ensure that the appropriate type, quantity, and quality of radiological characterization data are obtained.

Both direct and indirect methods can be used for characterization (DOE M 435.1-1). When indirect methods are used, these methods must be corroborated periodically with direct measurements. The frequency of corroborative analysis should be based on the variability of the waste generating process, and the extent and consistency of previous analytical data. A graded approach should be applied when determining the appropriate type and frequency of corroborative analysis.

The following characterization methods can be used individually or in combination to establish the radionuclide inventory of the waste.

- Process knowledge—Process knowledge includes documented knowledge of the radioactive materials used and the processes that contributed to the radiological content of the waste, along with historical analysis of waste and radiological contamination from the process. Process knowledge can be used to establish the suspected major radionuclides in a waste stream. In addition, process knowledge can be used to eliminate from further consideration those radionuclides not present in sufficient concentration to be major radionuclides as defined in Section 2.5.1, as long as the basis of this determination is documented.
- Radionuclide material accountability—The content of a given radionuclide in a waste can be determined by documented logs detailing the mass or activity of that radionuclide added to and leaving the waste in a controlled process. In addition, data relating the total inventory of a radionuclide in a process or facility can be used to determine the radionuclide inventory, but must be corroborated periodically with direct measurement methods.
- Field and laboratory analysis methods—Field and laboratory analysis methods, such as NDA, radiochemical analysis, and surveys with field instruments, must be selected as appropriate to detect and quantify the major radionuclides with adequate sensitivity and accuracy for waste classification. Analysis methods that measure gross activity (i.e., not radionuclide specific) must be used in conjunction with other methods to determine the relative concentration (scaling factors) of each suspected radionuclide, and must be corroborated periodically with radionuclide-specific analysis.
- Computer modeling—Computer modeling, applied appropriately, could be used in conjunction with other methods for radiological characterization. An individual who is knowledgeable and experienced in the use and limitations of the model must perform the modeling. The assumptions and measurements used as inputs to computer modeling must be

documented. The computer software must be controlled in a manner that meets conventional quality assurance requirements. Computer models must be corroborated periodically with direct measurement methods.

- **Scaling factors**—Scaling factors can be used to relate the concentration of a readily measured radionuclide to more difficult-to-measure radionuclides. Scaling factors must be developed from one of the previous methods, and must be corroborated periodically with radionuclide-specific analysis.

Other methods of radiological characterization could be used, but must be documented clearly and approved by the WSD Project acceptance organization. Documentation of the method must include a detailed description of the method, the radionuclides identifiable by the method, and a discussion of precision, accuracy, quality assurance and quality control methods.

2.5.3 Additional Detail on Mobile Radionuclide Characterization

For low-level and low-level mixed waste, mobile radionuclide reporting is critical for compliance with the LLBG performance assessments (WHC-EP-0645 and WHC-SD-WM-TI-730). Because of the low reporting limits and difficulty of analysis of certain mobile radionuclides, this section provides additional detail concerning acceptable knowledge and characterization.

The concentration of each mobile radionuclide must be established and compared to the Appendix A, Table A-2, reporting limit using process knowledge and/or analysis. If process knowledge alone is used to determine that a mobile radionuclide is not present in a waste stream at the reporting limit, the basis for this determination must be clearly documented. If available analytical techniques cannot detect a mobile radionuclide at its reporting limit, the concentration could be estimated using a combination of process knowledge, scaling factors, and analytical detection limits.

Mobile radionuclide reporting is intended to measure only the quantity of isotopes that exceeds Hanford Site natural background concentrations. For waste forms that contain uranium that originates from natural background on the Hanford Site, the background concentration of that radionuclide can be subtracted from the total concentration.

2.5.4 Recertification

The radiological characterization of waste streams must be recertified with sufficient frequency to account for changes in the generating process, radiological composition, and radiological decay.

2.5.5 Radioactive Material Shipments Less Than Values Specified In 49 CFR 173.436 or Derived According to 49 CFR 173.433

- All shipments of radioactive materials having activities or activity concentrations less than those listed in 49 CFR 173.436 or derived according to 49 CFR 173.433 are exempt from U.S. Department of Transportation (DOT) Regulations. These materials shall be shipped in a container that ensures no loss of the radioactive material during loading, inspections, transportation, and unloading.
- The shipping documentation shall have the following statement placed on it. “The following Container(s) _____ Contain Radioactive Material at concentrations that are not regulated for transportation per DOT Regulations in 49 CFR 173.403, but are not releasable per DOE Order 5400.5 (1990/1993).”
- A radiological survey report shall identify the package radiation exposure rates (i.e., contact and 30 centimeter readings), the expected radionuclides, associated activity levels and package contamination levels, including an evaluation of hard-to-detect radionuclides (e.g., H-3), when necessary. The radiological survey report shall be sent with the shipment as part of the shipping documents.

2.6 WASTE SEGREGATION AND TREATMENT AND/OR DISPOSAL PATH

The following sections discuss waste segregation and the treatment and/or disposal path.

2.6.1 Segregation of Uncontaminated Waste from Radioactive Waste

Generators shall segregate uncontaminated waste from radioactive waste to minimize waste volume and the cost of waste treatment and disposal (DOE M 435.1-1).

2.6.2 Radiological Release of Waste

Generators shall attempt to obtain radiological release of dangerous waste and TSCA PCB waste generated from radioactive material areas in accordance with their site/facility radiological release criteria, unless one or more of the following conditions apply (for Hanford Site Project Hanford Management Contract [PHMC] generators, the Site release criteria are discussed in HNF-PRO-20377 and HNF-13536).

- Radiological contamination in the waste is measurable using field instruments.
- Process knowledge clearly identifies that radiological contamination was introduced into the waste.
- The analytical limit of detection for the waste matrix is above the Site/facility radiological release limits (for Hanford Site PHMC generators, HNF-PRO-20377 and HNF-13536).

- The waste is treated and directly disposed as radioactive waste at a cost that is lower than the cost of radiological release and disposal as nonradioactive waste.

The basis for use of these conditions must be documented as part of the radiological characterization record(s) for the waste.

2.6.3 Segregation for Treatment, Storage, and/or Disposal

All waste shall be segregated by the WSRds and waste stream profiles to facilitate proper treatment, storage, and/or disposal. The WSRds identify major waste streams, grouped in a manner that defines currently available storage and disposal methods and, for waste requiring treatment, the anticipated treatment and/or disposal methods. When it is not technically feasible or it is cost prohibitive to segregate a given waste stream by WSRd and profile, the generator must document the basis for not segregating the waste. Acceptance of non-segregated waste is contingent on either (1) the WSD Project acceptance organization identifying a treatment/disposal pathway or (2) approval by the RL to receive the waste stream for storage.

WSRds will include certain waste stream-specific requirements to facilitate treatment, storage, and/or disposal. These criteria must be met in addition to the criteria identified in this document.

The current set of WSRds, along with instructions for selecting the appropriate WSRd, can be obtained from the *Hanford Site Solid Waste Acceptance Program* Internet web site (<http://www.hanford.gov/wastemgt/wac/>).

2.6.4 Waste Streams Having No Established Treatment/Disposal Path

Every effort shall be made to avoid the generation of waste for which no treatment/disposal path has been identified.

Written RL approval is required for acceptance of any waste stream that has no established treatment/disposal path.

2.6.5 Low-Level Mixed Waste From Non-PHMC Generators

Low-level mixed waste from non-PHMC generators that requires treatment to meet LDR requirements shall be treated as required to meet LDR treatment standards prior to delivery to PHMC disposal units. Non-LDR-compliant low-level mixed waste presented for storage will be considered on a case-by-case basis when no treatment path is available or for treatment and disposal when treatment at the disposal facility is proposed.

2.7 MANAGEMENT AND CERTIFICATION OF TRANSURANIC WASTE

Transuranic waste has a unique set of management and certification requirements based on DOE/WIPP-02-3122 and DOE/WIPP-02-3214. The Hanford Site meets these requirements through implementation of HNF-2600 and HNF-2599. Requirements applicable to generators of contact- and remote-handled transuranic waste are identified in Appendix G and I respectively.

2.8 RECORDS

The generator must retain all record copy material used for waste characterization and designation in accordance with federal and state requirements and DOE Orders. These records include process knowledge, sampling information, analytical data, inventory records, and related information. The generator must transfer copies of certain records as requested by the WSD Project acceptance organization through the waste acceptance process described on the *Hanford Site Solid Waste Acceptance Program* Internet web site (<http://www.hanford.gov/wastemgt/wac/>).

2.9 CLASSIFIED AND ACCOUNTABLE NUCLEAR MATERIAL

Radioactive waste to which access has been limited for national security reasons and which cannot be declassified shall be managed in accordance with the requirements of DOE M 470.4-2, and DOE O 470.4, (DOE M 435.1-1).

During the acceptance process, the generator shall notify the WSD Project acceptance organization of any classified waste. Classified waste is managed on a case-by-case basis.

A DOE/NRC 741 form must be completed for waste that contains accountable nuclear material (DOE O 470.4).

2.10 WASTE VERIFICATION

A portion of the waste containers sent to Hanford Site TSD units must be verified by physical inspection, nondestructive examination, and/or chemical screening as stated in waste analysis plans for the TSD units (e.g., HNF-1886 or HNF-9921). For most waste types, this verification can be performed at one of the Hanford Site TSD units. Certain types and configurations of waste, however, cannot be verified easily and could require verification at the generator's location before or during packaging. In these cases, generators must notify the Hanford Site acceptance organization and make verification arrangements before packaging the waste. This requirement applies to the following types of waste.

- Shielded waste.
- Remote-handled waste.
- Waste packaged in containers where the length is greater than or equal to 2.90 meters (9 feet 6 inches); width at bottom is greater than or equal to 1.61 meters (5 feet 3.5 inches); width

(above 2 feet from bottom) is greater than or equal to 1.93 meters (6 feet 4 inches); and height is greater than or equal to 1.64 meters (5 feet 4.75 inches). These dimensions are absolute dimensions including any attachments such as lifting bails, lid flanges, etc.

- Waste containers weighing more than 3,175 kilograms (7,000 pounds).
- Mixed waste treated by macroencapsulation or microencapsulation.
- Highly compacted (supercompacted) waste.
- Waste packaged in plastic outer containers.
- Other waste that is to be treated or packaged in a form that cannot be inspected easily subsequent to treatment or packaging.

2.11 PHYSICAL AND CHEMICAL CRITERIA

The following are the physical and chemical criteria for acceptance of all waste.

2.11.1 Chemical Compatibility

All waste placed in a given outer container shall be chemically compatible (WAC 173-303-630).

2.11.2 Asbestos-Containing Waste

Asbestos-containing waste material shall be packaged in accordance with 40 CFR 61.150. Wetting with water is allowed as long as the liquid does not exceed applicable free liquid requirements (Section 3.3.1).

2.11.3 Heat Generation

If heat generation from radiological decay in the waste package exceeds 3.5 watts per cubic meter (0.1 watt per cubic foot), the package must be evaluated to ensure that the heat does not affect the integrity of the container or surrounding containers in storage. This evaluation must be provided to and approved by the WSD Project acceptance organization.

2.11.4 Gas Generation

Generators shall provide evidence of compliance with DOE M 435.1-1. When vents are required by this section, a certificate of conformance shall be provided stating the vent model number that

has been installed on the waste container and that the waste packaging meets the requirements of this section.

When low-level waste is packaged, vents or other measures shall be provided if the potential exists for pressurizing or generating flammable or explosive concentrations of gases within the waste container (DOE M 435.1-1, Chapter IV, L.1.b). Unless otherwise specified by the WSD Project acceptance organization, a minimum five-year time value shall be used to demonstrate compliance when performing gas generation calculations for low-level waste going directly to disposal.

When a container of newly generated transuranic waste is packaged, vents or other mechanisms shall be provided at the time the waste is packaged to prevent pressurization of the container or generation of flammable or explosive concentrations of gases. Containers of currently stored waste shall meet this requirement as soon as practical unless analyses demonstrate that the waste can otherwise be managed safely (DOE M 435.1-1, Chapter III, L.1.b).

If required, the following mitigating measures (or alternative measures approved by the WSD Project acceptance organization) must be used.

- Control of hydrogen from radiolytic decomposition: Use an approved vent, as listed in Appendix H, or an approved alternative. All container liners and inner bags must be closed in a manner that allows gas to reach the vent filter (e.g., twist and tape method for bags). When 90-mil liners are used, the hole size used to vent the liner shall be documented. In addition to filtering, palladium or platinum catalyst packs may be used to control hydrogen concentrations in the container.
- Control of hydrogen from biological decomposition: Waste containing readily biodegradable organic materials (e.g., animal waste, vegetation) must be vented with an approved vent, as listed in Appendix H, or an approved alternative. In addition, slaked lime shall be added to the waste to reduce biological decomposition if filtering alone is not sufficient to control combustible gas generations.

2.12 RADIOLOGICAL CRITERIA

The following are the radiological criteria for acceptance of waste.

2.12.1 Criticality Safety Limits

The fissile and fissionable material content limits are provided in Appendix B. Drums with non-exempt quantities of fissile materials normally must have a minimum steel mass of 23 kilograms (50.7 pounds) in accordance with Table B-2, Footnote b (HNF-14741).

2.12.2 Dose Equivalent Curie Limits

Waste must meet the safety basis limit of 82.5 dose-equivalent curies per container. Radionuclide quantities greater than 82.5 dose-equivalent curies per container may be accepted based on specific container and waste forms but must be evaluated to ensure compliance with safety basis criteria (HNF-15280).

Additionally, each facility has inventory limits as described in HNF-15280. Waste receipts are controlled by each facility to maintain the inventory within these limits.

2.12.3 Package Removable Contamination Limits

Removable contamination on accessible surfaces of waste packages shall not exceed the limits of HNF-5173, Table 2-2. Use of fixatives is not allowed to meet the criteria. For returnable overpacks, the contamination limits and fixative prohibition also applies to the outside of the inner package.

In addition, elevated concentrations of tritium may accumulate when tritium diffuses as HTO vapor from containers and concentrate in the cargo area. Shipments that are greater than 100 Ci of tritium should be shipped in open conveyances.

2.13 PACKAGING CRITERIA

The following are the packaging criteria for acceptance of waste.

2.13.1 Container Selection

The packages for waste shall meet applicable 49 CFR container requirements for the hazard class/division of the waste, except that packaging for onsite transfers under an approved package-specific safety document might be allowed where cost or technical constraints make the use of a DOT-compliant package unfeasible. If the waste does not meet the definition of any DOT hazard class, a container meeting the general requirements of 49 CFR 173.410 is adequate.

2.13.2 Condition of Containers

Outer containers shall be in good condition, with no visible cracks, holes, dents, bulges, pit or scale corrosion, or other damage that could compromise container integrity (WAC 173-303-630). Minor external surface rust that can be sanded or brushed off will be acceptable. Containers having some pit or scale corrosion could be acceptable for storage provided the integrity of the container is confirmed. Polyurea coated containers must have a Flame Spread rating of 25 or less for acceptance into CWC.

2.13.3 Securing Waste and Shielding

For newly generated waste, drums on pallets shall be strapped together prior to loading on the shipping transport vehicle. Large heavy items must be secured in containers by bracing, blocking, or other means to prevent damage to the container during handling and transportation. When shielding is used to reduce the surface dose rate of a waste container, the shielding and waste must be secured to prevent shifting during handling and transportation. Externally attached shielding is prohibited.

2.13.4 Labeling

Packages shall be labeled according to the instructions in Appendix C.

3.0 ACCEPTANCE CRITERIA FOR DISPOSAL IN THE LOW-LEVEL BURIAL GROUNDS

This chapter outlines the criteria necessary in order to comply with the regulatory, permitting, safety, environmental, and operational requirements for the low-level and low-level mixed waste disposal in the LLBG.

3.1 FACILITY DESCRIPTION AND FUNCTION

Trenches 31 and 34 of the 218-W-5 Burial Ground are RCRA-compliant units for disposal of certain low-level mixed waste. Currently, only low-level waste and low-level mixed waste originally designated with RCRA characteristic numbers D001 through D043, certain listed, discarded chemical product waste numbers (U- and P- listed waste), certain F- listed waste F001 through F012, F019, F028, and F039 (derived from F001 through F012, F019 and F028), and Washington state-only dangerous waste (except waste number WSC2-acid) are accepted in trenches 31 and 34. Waste accepted at trenches 31 and 34 must meet the LDR treatment standards of 40 CFR 268 and WAC 173-303-140 as applicable. There also are safety-based and environmentally based limits on the radionuclide concentrations of waste received.

Table 3-1. LLBG Dangerous Waste Numbers.

| Characteristic Waste “D” Series | Nonspecific Source “F” Series | Discarded Chemical Product “U” Series | Discarded Chemical Product “P” Series | Washington State-Only “W” Series |
|------------------------------------|----------------------------------|--|--|-------------------------------------|
| D001–D043 | F001 | U001–U012 | P001–P018 | WT01 |
| | F002 | U014–U039 | P020–P024 | WT02 |
| | F003 | U041–U053 | P026–P031 | WP01 |
| | F004 | U055–U064 | P033 | WP02 |
| | F005 | U066–U099 | P034 | WP03 |
| | F006 | U101–U103 | P036–P051 | WSC2* |
| | F007 | U105–U138 | P054 | WPCB |
| | F008 | U140–U174 | P056–P060 | |
| | F009 | U176–U194 | P062–P078 | |
| | F010 | U196 | P081 | |
| | F011 | U197 | P082 | |
| | F012 | U200–U223 | P084 | |
| | F019 | U225–U228 | P085 | |
| | F028 | U230–U240 | P087–P089 | |
| | F039 | U242–U244 | P092–P099 | |
| | | U246–U249 | P101–P116 | |
| | | U271 | P118–P123 | |
| | | U277–U280 | P127 | |
| | | U328 | P128 | |

| | | U407 | | |
| | | U409–U411 | | |

*See Section 3.2

3.2 PROHIBITED WASTE

The following types of waste are not disposed in trenches 31 and 34.

- Waste designated with WSC2-acid (DOE/RL-88-21).
- TSCA-regulated PCB waste, except as specifically authorized by 40 CFR 761.
- *Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA)* waste shipped directly from the generator, unless the U.S. Environmental Protection Agency (EPA) has specifically approved (e.g., a Record of Decision) management of the waste at the LLBG.
- Waste that does not comply with the requirement of DOE M 435.1-1, Chapter IV, G.1.d.1. Low-level waste must contribute to and not detract from achieving long-term stability of the

facility, minimizing the need for long-term active maintenance, minimizing subsidence, and minimizing contact of water with waste. Void spaces within the waste and, if containers are used, between the waste and its container shall be reduced to the extent practical (DOE M 435.1-1, Chapter IV, G.1.d.1).

- Waste that does not comply with the requirement of DOE M 435.1-1, Chapter IV, G.1.d.2. Liquid low-level waste or low-level waste containing free liquid must be converted into a form that contains as little freestanding liquid as is reasonably achievable, but in no case shall the liquid exceed 1 percent of the waste volume when the low-level waste is in a disposal container, or 0.5 percent of the waste volume after it is processed to a stable form (DOE M 435.1-1, Chapter IV, G.1.d.2).
- Waste that does not comply with the requirement of DOE M 435.1-1, Chapter IV, G.1.d.3. Low-level waste must not be readily capable of detonation or of explosive decomposition or reaction at anticipated pressures and temperatures, or of explosive reaction with water. Pyrophoric materials contained in waste shall be treated, prepared, and packaged to be nonflammable (DOE M 435.1-1).
- Waste that does not comply with the requirement of DOE M 435.1-1, Chapter IV, G.1.d.4. Low-level waste must not contain, or be capable of generating by radiolysis or biodegradation, quantities of toxic gases, vapors, or fumes harmful to the public or workers or disposal facility personnel, or harmful to the long-term structural stability of the disposal site (DOE M 435.1-1). Additional requirements related to these criteria are listed in Section 2.11.4.
- Waste that does not comply with the requirement of DOE M 435.1-1, Chapter IV, G.1.d.5. Low-level waste in a gaseous form must be packaged such that the pressure does not exceed 1.5 atmospheres absolute at 20 degrees Celsius (68 degrees Fahrenheit) (DOE M 435.1-1). Additional requirements related to these criteria are listed in Section 2.11.4.
- Waste that does not meet all applicable treatment standards of 40 CFR 268 and WAC 173-303-140.
- Transuranic waste and waste that exceeds other radiological limits of Section 3.4.
- Waste that is incompatible with the trench liner, as defined in Section 3.3.3 (40 CFR 264.301; WAC 173-303-665; HNF-5841).

3.3 PHYSICAL AND CHEMICAL CRITERIA

The following are the physical and chemical criteria for acceptance of waste in the LLBG.

3.3.1 Liquids and Liquid-Containing Waste

All free liquids must be absorbed or stabilized in accordance with Appendix E, or otherwise removed from the waste, except when specifically allowed as follows.

- Containerized free liquids are allowed in the following situations, but cannot exceed 1 percent of the volume of the waste (40 CFR 264.314, HNF-5841).
 - Free liquids in a very small container, such as an ampule.
 - Small articles that contain free liquids required for the article to function (e.g., batteries or capacitors).
- For liquid-containing waste where condensate could form in inner plastic packaging (e.g., bags) subsequent to packaging, the condensate shall be eliminated to the maximum extent practical by placing sorbents within the inner plastic packaging (HNF-5841). The type and amount of sorbent required shall be in accordance with Appendix E. In any case, the amount of liquid may not exceed 1 percent of the volume of the waste or 0.5 percent of waste processed to a stable form (DOE M 435.1-1).
- Residual liquids in large debris items shall be sorbed or removed. In cases where it is not practical to remove suspected liquids and it is impossible to sample to determine if liquids are present, the liquids shall be removed to the maximum extent possible by draining suspected liquids at low points and placing an adequate amount of sorbent around each item (HNF-5841). In any case, the amount of liquid cannot exceed 1 percent of the volume of the waste (DOE M 435.1-1).

3.3.2 Land Disposal Restrictions

All waste subject to RCRA LDR (40 CFR 268) and/or the Washington State LDR (WAC 173-303-140) must be demonstrated to meet all applicable treatment standards and requirements. For waste that has concentration-based treatment standards for specific hazardous constituents under 40 CFR 268, the waste must be tested at a Hanford Site laboratory or another independent laboratory in accordance with 40 CFR 268. For waste that has treatment standards that are not concentration-based, the generator and/or treatment facility must demonstrate that the waste meets the applicable treatment standards using process knowledge and/or by waste analysis, as required by the applicable sections of 40 CFR 268 and WAC 173-303-140 (HNF-5841).

3.3.3 Compatibility of Waste With Liner

All waste disposed in the LLBG must be compatible with the landfill liner system (HNF-5841). A variety of chemical constituents have been evaluated for compatibility with the liner system, and it is believed that waste that meets LDR requirements and the other acceptance criteria of this chapter will be compatible (HNF-5841, WHC-SD-WM-TI-714). An assessment will be performed by the WSD Project acceptance organization on each waste stream to confirm the compatibility of the waste with the liner. In cases where a waste contains constituents that have not been evaluated previously for liner compatibility, testing by Method 9090 of SW-846 could be required.

NOTE: Table 3-2 lists certain chemical constituents, in concentrated form, that have been evaluated and determined to be incompatible with the liner.

3.3.4 Gas Generation

Radioactive animal carcasses must be packaged as follows.

- The waste must be packaged in an inner and outer metal package, where the outer package has a capacity at least 40 percent greater than that of the inner package. The outer package must be a metal container that meets applicable transportation requirements for shipment to the LLBG.
- The inner package shall be lined with a minimum 4-mil plastic liner. The animal carcass(es) in the inner package must be surrounded with slaked lime. The plastic liner and inner package must be sealed.
- A minimum of 7.6 centimeters (3 inches) of mineral sorbent must be placed in the bottom of the outer package. The inner package must be placed into the outer package, and the void space filled between the two packages with additional mineral sorbent.
- The outer package must be sealed.

3.4 RADIOLOGICAL CRITERIA

The following are the radiological criteria for acceptance of waste in the LLBG.

3.4.1 Radiological Concentration Limits

The methodology for classification of the radionuclide content of waste according to the various limits listed in the following sections is provided in Appendix A. A waste must meet all of the following conditions to be disposed in the LLBG.

- TRU content limit. TRU content (as calculated by method A1.1 of Appendix A) shall not exceed 100 nanocuries (3,700 becquerels) per gram of waste (DOE M 435.1-1).
- Waste category (as calculated by methods A1.4 and A1.5 of Appendix A) shall not exceed Category 3, except with an analysis coordinated by the WSD Project acceptance organization demonstrating that the LLBG performance assessment conditions are met (WHC-EP-0645, WHC-SD-WM-TI-730).
- Category 3 waste (as calculated by methods A1.4 and A1.5 of Appendix A) can be disposed of only if the waste meets one of the following waste form stability criteria (WHC-EP-0645, WHC-SD-WM-TI-730).

- Packaging in a high-integrity container (HIC) that is procured through WHC-S-0486 specification.
- Packaging in a HIC approved by the WSD Project acceptance organization.

NOTE: A list of approved HICs is available on the *Hanford Site Solid Waste Acceptance Program* Internet web site (<http://www.hanford.gov/wastemgt/wac/>).

- Placement in a monolith in the LLBG.
- Stabilization in concrete or other stabilization agents. The stabilized waste must meet the leach index and compression strength criteria of the U.S. Nuclear Regulatory Commission (NRC) *Technical Position Paper on Waste Form*, Section C.2 and Appendix A (NRC 1991). Several Hanford-approved concrete mix formulas have been developed that can be used to meet the stabilization criteria. Contact the WSD Project acceptance organization for information on use of these formulas.
- Inherently stable waste that meets the stability requirements of 10 CFR 61.56 and the NRC *Technical Position Paper on Waste Form* (NRC 1991).
- Mobile radionuclides. If the concentration of any mobile radionuclide exceeds the Mobile Radionuclide Reporting Limit of Appendix A, Table A-2, stabilization could be required (WHC-EP-0645, WHC-SD-WM-TI-730). The WSD Project acceptance organization will perform a case-by-case evaluation based on the LLBG performance assessment (WHC-EP-0645, WHC-SD-WM-TI-730) to determine whether the waste requires stabilization to meet the groundwater pathway dose criteria. Stabilization normally would consist of placing the waste container in a HIC, but additional stabilization might be required based on a number of factors such as waste form and radionuclide content. The WSD Project acceptance organization will coordinate this evaluation.

3.4.2 Criticality Safety Limits

The fissile and fissionable material limits are provided in Appendix B. Note that fissile waste packages can be accepted only with an approved criticality safety evaluation (refer to Footnote 1 of Table B-3 in Appendix B). Drums with non-exempt quantities of fissile materials normally must have a minimum steel mass of 23 kilograms (50.7 pounds) in accordance with Table B-2, Footnote b.

3.4.3 Package Dose Rate Limits

Containers with dose rates less than or equal to 2 milliSieverts per hour (200 millirem per hour) at contact and less than 1 milliSievert per hour (100 millirem per hour) at 30 centimeters (11.8 inches) are acceptable at the LLBG. Contact-handled containers (see definitions) exceeding these limits require container-specific review and approval.

Remote-handled waste is acceptable at the LLBG if approved through both a waste stream profile sheet and a container-specific shipment. Remote-handled waste shall meet the applicable dose rate restrictions of DOT or an approved package-specific safety document. Remote-handled waste shall be configured for unloading such that personnel exposures are maintained as low as reasonably achievable (ALARA).

3.5 PACKAGING CRITERIA

The following are packaging criteria for acceptance in the LLBG.

3.5.1 Package Construction

Containers must meet one of the following criteria to ensure compliance with HNF-21239, *Solid Waste Operations Complex Fire Hazard Analysis*.

- Constructed of metal, concrete, or masonry.
- Constructed of wood that is either (1) pre-treated wood having the Underwriters Laboratories FR-S stamp, or (2) painted with a fire-retardant paint that has been approved by Underwriters Laboratories or Factory Mutual.
- Constructed of rigid plastic that has a maximum flame spread rating of 25 when tested by a nationally recognized testing laboratory to American Society for Testing of Materials (ASTM) Standard Test Method for Surface Burning Characteristics of Building Materials (ASTM E-84, most current version). These containers will only be accepted if approved by WSD Project Fire Protection Engineering.
- Constructed of flexible plastic packaging provided the waste matrix is limited to soils, metals, concrete, or masonry. Incidental amounts of organic material such as personal protective equipment are allowed in flexible packaging.
- Other containers as authorized under the LLBG Fire Hazards Analysis and approved by WSD Project Fire Protection Engineering.

Sacrificial rigging shall not contain regulated materials, such as lead.

Containers shall be compatible with the waste and maintain containment during handling and storage before disposal. Where required, an appropriate combination of protective coatings and liners shall be used to prevent loss of container integrity.

3.5.2 Handling of Packages

All packages must be configured for safe unloading by forklift or crane. Alternate means of unloading could be allowed with approval from the TSD unit manager or designee. Packages that must be unloaded by crane shall be equipped with a lifting system designed to safely lift the

fully loaded package. All slings and lifting devices shall meet the requirements of the most current version of DOE/RL-92-36. For packages that have special unloading requirements, information must be provided to the WSD Project acceptance organization concerning the methods for unloading before the shipment is scheduled. Sacrificial rigging shall be provided for remote-handled waste packages. Rigging shall not contain regulated materials, such as lead.

3.5.3 Minimization of Subsidence

All waste shall be packaged in a form that minimizes settling and subsidence to the maximum extent feasible (DOE M 435.1-1, WHC-EP-0645, and WHC-SD-WM-TI-730). All waste accepted for disposal in the LLBG must meet one of the following minimization of subsidence criteria at the time of disposal:

- Packaged in a HIC that is procured through the WHC-S-0486 specification.
- Packaged in a HIC approved by the Fluor Hanford WSD Project.
- Compactable waste that has been compacted to a minimum pressure of 3.52 kilograms per square centimeter (50 pounds per square inch).
- A solid with a minimum “confined” compressive strength of 3.52 kilograms per square centimeter (50 pounds per square inch).
- Placed in a Hanford-provided in-trench structural monolith meeting the requirements of HNF-1981 specification for concrete encasements (allowed by WSD on a case-by-case basis).

All containerized waste must be at least 90 percent full when placed in the disposal unit (WAC 173-303-665).

3.5.4 Labeling

Bulk waste and remote-handled waste containers that are removed from reusable overpacks are exempt from labeling requirements at the LLBG. For unusual waste forms, special labeling provisions can be arranged with the WSD Project acceptance organization.

3.5.5 Bulk (Noncontainerized) Waste

Bulk waste can be disposed in the LLBG, on a case-by-case basis. Waste shall meet the following requirements to be considered.

Certain types of waste can be disposed in bulk rather than packaging in containers. This includes soil, vegetation, building rubble, and other homogeneous waste having relatively low concentrations of radionuclides and hazardous chemical constituents. To avoid unnecessary conservatism, universally applicable limits have not been developed for the LLBG acceptance criteria. Instead, a case-by-case evaluation will be performed on request to determine whether a given waste stream can be disposed in bulk. Any mitigating measures required to meet the conditions of the safety basis will also be determined on a case-by-case basis.

Waste types that are not surface contaminated with readily dispersible radiological or hazardous chemical contamination, such as activated metal or internally contaminated equipment, may be considered containerized. As such, they are subject to the radionuclide and chemical concentration requirements for containerized waste rather than the bulk waste requirements.

Table 3-2. Chemical Constituents Known To Be Incompatible With Liner System.

| Chemical Constituent | Chemical Abstract Service Number(s) |
|--|-------------------------------------|
| Aqua regia | 8007-56-5 |

4.0 ACCEPTANCE CRITERIA FOR THE CENTRAL WASTE COMPLEX

This chapter outlines the criteria necessary in order to comply with the regulatory, permitting, safety, environmental, and operational requirements at the CWC.

4.1 FACILITY DESCRIPTION AND FUNCTION

The CWC is a storage and treatment unit for low-level mixed, TRU, TRU mixed, TSCA PCB waste, and other waste types requiring treatment before disposal. Waste stored at the CWC will be treated and repackaged as required for disposal as treatment capabilities become available.

The CWC manages waste having characteristic waste numbers D001 through D043, certain listed, discarded chemical product waste numbers (U- and P- listed waste), certain F-listed waste (F001 through F012, F019 through F023, F026 through F028, and F039), and all Washington state-only waste numbers. Table 4-1 lists the acceptable dangerous waste numbers from the approved CWC Part A, Form 3 (DOE/RL-88-21). In addition, the CWC manages TSCA PCB waste from Hanford Site generators in accordance with 40 CFR 761. The CWC also can store waste from CERCLA cleanup activities.

Table 4-1. CWC Dangerous Waste Numbers.

| Characteristic Waste “D” Series | Nonspecific Source “F” Series | Discarded Chemical Product “U” Series | Discarded Chemical Product “P” Series | Washington State–Only “W” Series |

| | | U407 | | |
| | | U409–U411 | | |

4.2 PROHIBITED WASTE

The following wastes are not accepted for storage at the CWC.

- Liquid waste, except if packaged in labpacks or overpacks in quantities less than or equal to 57 liters (15 gallons) per outer container.
- Compressed gases packaged at pressures in excess of 1.5 atmospheres (152 kilopascals absolute pressure) at 20 degrees Celsius (68 degrees Fahrenheit), except that pressurized aerosol cans can be accepted (DOE M 435.1-1). Additional requirements related to these criteria are listed in Section 2.11.4.
- See Section 2.3.

4.3 PHYSICAL AND CHEMICAL CRITERIA

The following are the physical and chemical criteria for acceptance of waste at the CWC.

4.3.1 Liquids and Liquid-Containing Waste

Sorption of liquids is allowed, but must be compatible with the treatment methods anticipated for disposal. Liquids must be sorbed or stabilized in accordance with Appendix E.

For waste that could form condensate during storage, sufficient sorbent shall be added to the container to sorb any condensate formed.

4.4 RADIOLOGICAL CRITERIA

The following are the radiological criteria specific to the CWC

4.4.1 Package Dose Rate Limits

Waste packages shall not exceed 1 milliSievert per hour (100 millirem per hour) at 30 centimeters (1 foot) from the waste package and 2 milliSieverts per hour (200 millirem per hour) at any point on the surface of the package.

4.5 PACKAGING CRITERIA

The following are the packaging criteria for acceptance at the CWC.

4.5.1 Container Selection

Outer containers shall be constructed of noncombustible materials. Wood, fiberboard, and plastic outer containers are prohibited (HNF-15280).

4.5.2 Protective Coatings and Liners

The packaging for stored waste shall include coatings and/or liners sufficient to maintain the integrity of the containment system during the anticipated storage life of the waste, as follows.

- The exterior coating of containers shall be alkyd enamel, galvanized, or an alternative coating with performance equivalent to or better than alkyd enamel.

- The interior coatings and liners shall be chemically compatible with the waste and shall protect the containment system from corrosion over the anticipated storage life of the waste (WAC 173-303-630). Unless otherwise specified by the WSD Project acceptance organization, the storage life should be assumed to be 20 years. For containers procured under Hanford Site container procurement specifications, Appendix D defines preferred coating and liner options.

4.5.3 Packaging of Liquid Waste in Labpacks

The following are requirements for packaging of liquid waste as lab packs and overpacked liquids.

- Up to 57 liters (15 gallons) of liquid can be packaged in inner glass, metal, or plastic containers. Glass containers shall not exceed 4 liter (1.1-gallon) capacity each. Sufficient head space must be left in the inner containers to prevent breakage because of expansion in temperatures up to 55 degrees Celsius (131 degrees Fahrenheit) and freezing conditions.
- Inner containers shall be securely closed. The lids of glass containers shall be sealed with Teflon¹ or equivalent lid seals (gaskets). After closure, glass lids shall be taped.
- All inner containers shall be compatible with the waste contents over the anticipated storage life of the waste.
- Each inner container shall be labeled with its contents.
- A sufficient quantity of suggested sorbent (selected in accordance with Appendix E) shall be packaged around the inner containers to sorb twice the volume of the liquid in the inner containers. The sorbent shall be placed around the inner containers in a manner that prevents shifting and breakage.

4.5.4 Package Size and Weight Limits

The following are the baseline size limits for the CWC storage modules (Table 4-2). Larger containers could be accepted into specific storage modules with special loading procedures. Drums smaller than 208 liters (55 gallons) are not accepted on a routine basis, but could be approved on a case-by-case evaluation.

¹Teflon is a registered trademark of E. I. DuPont de Nemours & Company, Wilmington, Delaware.

Table 4-2. Central Waste Complex Container Size and Floor Loading Limits.

| Storage Units | Package Size Limit | Floor Loading Limit |
|---|--|--|
| Alkali metal modules | 321 liter (85-gallon) drum | 1,225 kilograms per square meter (250 pounds per square foot) |
| Low-flashpoint modules | 321 liter (85-gallon) drum | 1,225 kilograms per square meter (250 pounds per square foot) |
| 2401-W Building | 3.0 meters high by 3.4 meters wide (10 feet high by 11 feet wide) | 2,200 kilograms per square meter (450 pounds per square foot) |
| 2402-W Building | 3.0 meters high by 3.4 meters wide (10 feet high by 11 feet wide) | 3,430 kilograms per square meter (700 pounds per square foot) |
| 2402-WB through WL Buildings, 2403-W and 2404-W facilities | 3.0 meters high by 3.4 meters wide (10 feet high by 11 feet wide) | 9,800 kilograms per square meter (2,000 pounds per square foot) |

4.5.5 Stacking

Packages must be designed to withstand the weight of two layers of 208 liter (55-gallon) drums weighing 454 kilograms (1,000 pounds) each stacked on top.

4.5.6 Waste Pallets

Newly generated waste shall be stored on non-combustible pallets (HNF-21239). For this section, newly generated waste is defined as waste received at the CWC after October 1, 2002. Metal pallets will be used for any waste received after this date. Wooden pallets will only be accepted at the facility on a case-by-case basis to support transportation and/or special handling requirements (an exception to this criteria will be required).

5.0 ACCEPTANCE CRITERIA FOR THE T PLANT COMPLEX

This chapter outlines the criteria necessary in order to comply with the regulatory, permitting, safety, environmental, and operational requirements at the T Plant Complex.

5.1 FACILITY DESCRIPTION AND FUNCTION

The T Plant Complex is a treatment and storage unit having a number of functions, including equipment decontamination, waste treatment, storage, sampling, NDE, and repackaging. The 221-T Building is being prepared for the storage of K Basin sludge. In addition, this building can be used for decontamination, treatment, and storage of equipment and waste. The 2706-T Building is used for the decontamination, treatment, storage, etc., of equipment and waste having relatively low levels of radiological contamination. The 214-T Building is for storage purposes.

Wastes that can be managed at the T Plant Complex include TRU, TRU-mixed, low-level waste, hazardous/dangerous low-level mixed, and TSCA PCB waste. Table 5-1 lists the acceptable dangerous waste numbers from the approved T Plant Complex, Part A, Form 3 (DOE/RL-88-21). The T Plant Complex can also manage TSCA PCB (40 CFR 761) waste.

Table 5-1. T Plant Complex Dangerous Waste Numbers.

| Characteristic Waste “D” Series | Nonspecific Source “F” Series | Discarded Chemical Product “U” Series | Discarded Chemical Product “P” Series | Washington State-Only “W” Series |
|------------------------------------|----------------------------------|---|---|--|
| D001–D043 | F001–F012 F019–F028 F039 | U001–U012 U014–U039 U041–U053 U055–U064 U066–U099 U101–U103 U105–U138 U140–U174 U176–U194 U196 U200–U223 U225–U228 U234–U240 U243 U244 U246–U249 U271 U278–U280 U328 U353 U359 U364 U367 U372 U373 U387 U389 U394 U395 U404 U409–U411 | P001–P018 P020–P024 P026–P031 P033 P034 P036–P051 P054 P056–P060 P062–P078 P081 P082 P084 P085 P087– P089 P092–P099 P101–P116 P118–P123 P127 P128 P185 P188–P192 P194 P196–P199 P201–P205 | WT01 WT02 WP01 WP02 WP03 WSC2 WPCB |

Waste managed at the T Plant Complex could be sent to other Hanford Site TSD units for treatment, storage, and/or disposal. The acceptance criteria for these units must be met subsequent to processing at the T Plant Complex.

5.2 PROHIBITED WASTE

The following waste types are not accepted at the T Plant Complex:

- *CERCLA* waste shipped directly from the generator to the T Plant Complex, unless the EPA has specifically approved (e.g., a Record of Decision) management of the waste at the T Plant Complex.
- Compressed gases packaged at pressures in excess of 1.5 atmospheres (152 kilopascals absolute pressure) at 20 degrees Celsius (68 degrees Fahrenheit), except that pressurized aerosol cans can be accepted (DOE M 435.1-1). Additional requirements related to these criteria are listed in Section 2.11.4.
- See Section 2.3.

5.3 RADIOLOGICAL CRITERIA

The following are the radiological acceptance criteria specific to the T Plant Complex.

5.3.1 Package External Dose Rate Limits

Waste packages that exceed 1 milliSievert per hour (100 millirem per hour) at 30 centimeters (1 foot) from the waste package or 2 milliSieverts per hour (200 millirem per hour) at any point on the surface of the package require case-by-case evaluation for acceptance. When these dose rates are exceeded, the generator must provide detailed radiological survey data.

5.3.2 Internal Dose Rate and Contamination Limits for Decontamination and Processing

The contact dose rate for equipment and waste to be decontaminated or processed will be determined on a case-by-case basis during acceptance review. When internal contact dose rates exceed 1 milliSievert per hour (100 millirem per hour), the generator must provide detailed radiological survey information.

In addition, items with detectable alpha contamination may not be acceptable for decontamination or processing at the 2706-T Building. If the waste contains detectable alpha contamination, the generator must provide detailed radiological survey information to determine whether the waste can be processed.

5.4 PACKAGING CRITERIA

The following are the packaging criteria for acceptance of waste at the T Plant Complex.

5.4.1 Container Selection

Outer containers shall be constructed of metal or concrete, except that fire-retardant wooden boxes can be used. Wooden boxes shall be constructed of wood that is either (1) pre-treated wood having the Underwriters Laboratories FR-S stamp, or (2) painted with a fire-retardant paint that has been approved by Underwriters Laboratories or Factory Mutual.

5.4.2 Protective Coatings and Liners for Stored Waste

The packaging for waste to be stored shall include coatings and/or liners sufficient to maintain the integrity of the containment system during the anticipated storage life of the waste as follows.

- The exterior coating of containers shall be alkyd enamel, galvanized, or an alternative coating with performance equivalent to or better than alkyd enamel.
- The interior coatings and liners shall be chemically compatible with the waste and shall protect the containment system from corrosion over the anticipated storage life of the waste (WAC 173-303-630). Unless otherwise specified by the WSD Project acceptance organization, the storage life should be assumed to be 20 years. For containers procured under Hanford Site container procurement specifications, Appendix D defines preferred coating and liner options.

5.4.3 Container Size Limits

Container size limits are as follows.

- 2706-T: 12.2 meters (40 feet) long by 4.3 meters (14 feet) high by 3.7 meters (12 feet) wide.
- 221-T: 6.7 meters (22 feet) long by 4.0 meters (13 feet) high by 5.5 meters (18 feet) wide.
- 214-T: 6.0 meters (20 feet) long by 3.0 meters (10 feet) high by 3 meters (10 feet) wide.

These size limits may be exceeded on a case-by-case basis with approval from facility operations via a waste profile.

5.4.4 Container Weight Limits

General container weight limits are as follows. Heavier containers can be accepted on a case-by-case basis with T Plant Complex operations' approval.

- Drums shall not exceed 454 kilograms (1,000 pounds)
- Boxes shall not exceed their rated weight capacity
- Large equipment or packages shall not exceed the following limits.
 - 2706-T: 5,400 kilograms (11,900 pounds) (small vehicles); 9,100 kilograms (20,000 pounds) per axle or 36,000 kilograms (80,000 pounds) gross (heavy equipment). All limits can be exceeded on a case-by-case basis.
 - 221-T: 41,000 kilograms (90,000 pounds).

6.0 ACCEPTANCE CRITERIA FOR THE WASTE RECEIVING AND PROCESSING FACILITY

This chapter outlines the criteria necessary in order to comply with the regulatory, permitting, safety, environmental, and operational requirements at the WRAP.

The following acceptance criteria apply to newly generated waste sent to the WRAP. Newly generated TRU waste shall be managed in accordance with Section 2.7. Acceptance criteria for retrieved waste containers in the LLBG will be established through project-specific acceptance procedures.

6.1 FACILITY DESCRIPTION AND FUNCTION

The WRAP is a treatment and storage unit. The WRAP receives waste containers for verification, sampling, NDA, NDE, treatment, and repackaging.

Wastes that can be managed at the WRAP include TRU waste, TRU mixed waste, low-level waste, low-level mixed, and TSCA PCB waste. Table 6-1 lists the acceptable dangerous waste numbers from the approved WRAP Part A, Form 3 (DOE/RL-88-21). In addition, the WRAP manages TSCA PCB waste.

Table 6-1. The WRAP Dangerous Waste Numbers.

| Characteristic Waste “D” Series | Nonspecific Source “F” Series | Discarded Chemical Product “U” Series | Discarded Chemical Product “P” Series | Washington State-Only “W” Series |
|------------------------------------|----------------------------------|---|---|--|
| D001–D043 | F001–F012 F019–F028 F039 | U001–U012 U014–U039 U041–U053 U055–U064 U066–U099 U101–U103 U105–U138 U140–U174 U176–U194 U196 U197 U200–U223 U225–U228 U230–U240 U242–U244 U246–U249 U271 U277–U280 U328 U353 U359 U364–U367 U372 U373 U376–U379 U381–U387 U389–U396 U400–U404 U407 U409–U411 | P001–P018 P020–P024 P026–P031 P033 P034 P036–P051 P054 P056–P060 P062–P078 P081 P082 P084 P085 P087–P089 P092–P099 P101–P116 P118–P123 P127 P128 P185 P188–P192 P194 P196–P199 P201–P205 | WT01 WT02 WP01 WP02 WP03 WPCB WSC2 |

WRAP = Waste Receiving and Processing (Facility).

Waste managed at the WRAP could be sent to other Hanford Site TSD units for treatment, storage, and/or disposal. The acceptance criteria for these TSD units must be met subsequent to reprocessing waste at the WRAP.

6.2 PROHIBITED WASTE

The following waste types are not accepted at the WRAP.

- *CERCLA* waste shipped directly from the generator to the WRAP, unless the EPA has specifically approved (e.g., a Record of Decision) management of the waste at the WRAP facility.

- Compressed gases packaged at pressures in excess of 1.5 atmospheres (152 kilopascals absolute pressure) at 20 degrees Celsius (68 degrees Fahrenheit), except that pressurized aerosol cans can be accepted (DOE M 435.1-1). Additional requirements related to these criteria are listed in Section 2.11.4.
- Liquid waste, except if packaged in labpacks or overpacks in quantities less than or equal to 57 liters (15 gallons) per outer container.
- See Section 2.3.

6.3 PACKAGING CRITERIA

The following are the packaging criteria for acceptance at the WRAP.

6.3.1 Protective Coatings and Liners for Stored Waste

The packaging for mixed waste to be stored shall include coatings and/or liners sufficient to maintain the integrity of the containment system during the anticipated storage life of the waste.

- The exterior coating of metal containers shall be alkyd enamel, galvanized, or an alternative coating with performance equivalent to or better than alkyd enamel.
- The interior coatings and liners shall be chemically compatible with the waste and shall protect the containment system from corrosion over the anticipated storage life of the waste (WAC 173-303-630). Unless otherwise specified by the WSD Project acceptance organization, the storage life should be assumed to be 20 years. For containers procured under Hanford Site container procurement specifications, Appendix D defines preferred coating and liner options.

6.3.2 Noncombustible Containers

Outer containers shall be constructed of metal, except that fire-retardant wooden boxes can be used for low-level waste only. Wooden boxes shall be constructed of wood that is either (1) pre-treated wood having the Underwriters Laboratories FR-S stamp, or (2) painted with a fire-retardant paint that has been approved by Underwriters Laboratories or Factory Mutual. Additionally, wooden boxes must be overpacked in a metal box for NDA at the WRAP.

6.3.3 Package Size Limits

The container sizes that can be handled at the WRAP are as follows.

- Drums not exceeding 321 liters (85 gallons).
- Boxes less than the following dimensions can be received for NDE.

Length must be less than 2.90 meters (9 feet 6 inches); width at bottom must be less than 1.61 meters (5 feet 3.5 inches); width above 2 feet from bottom must be less than 1.93 meters (6 feet 4 inches); and height must be less than 1.64 meters (5 feet 4.75 inches). These dimensions are absolute dimensions including any attachments such as lifting bails or lid flanges.

6.3.4 Package Weight Limits

The maximum weight for containers handled at the WRAP is as follows.

- Drums: 453.5 kilograms (1000 pounds)
- Standard Waste Box: 1,814.3 kilograms (4000 pounds)
- Other Boxes: 3,175 kilograms (7,000 pounds)

6.3.5 Labeling

Packages shall be labeled as described in Appendix C.

6.4 PACKAGE DOSE RATE LIMITS

Containers with dose rates less than or equal to 2 milliSieverts per hour (200 millirem per hour) at contact and less than 1 milliSievert per hour (100 millirem per hour) at 30 centimeters (11.8 inches) are acceptable at WRAP. Containers exceeding these limits may be acceptable but will require container-specific review and approval by WRAP Operations.

A1.0 APPENDIX A

A1.1 RADIOLOGICAL CALCULATION METHODS

A variety of radiological calculations are required to determine whether a waste can be managed at Hanford Site treatment, storage, and/or disposal (TSD) units. The following sections describe the methodology for performing these calculations. For each calculation, the following assumptions shall be used.

- All major radionuclides in the waste, as defined in Section 2.5.1, must be considered in the calculations. If there is a major radionuclide in the waste that is not listed in Table A-1 and Table A-2, the generator must notify the Waste Stabilization and Disposition (WSD) Project acceptance organization to calculate the applicable limits and conversion factors.
- If a daughter radionuclide has a half-life less than 10 days and the parent radionuclide has a half-life greater than the daughter, the activity of the daughter should not be considered in the calculations.
- The volume of the outer waste container shall be used when limits are expressed in volume concentration. For example, a generator packaging a 1 liter jar (0.001 cubic meters) inside of a 208 liter (55-gallon) drum (0.208 cubic meters) would use the 0.208 cubic meter volume for radiological calculation purposes. An additional example is a concrete lined 208 liter (55-gallon) drum (0.208 cubic meters) having a 0.15 cubic meter waste capacity. The generator would again use 0.208 cubic meter for the radiological calculation volume. If the waste is not containerized, the volume is the anticipated volume the waste will occupy in the TSD unit.

A1.1.1 Transuranic Waste Determination

To determine whether a waste is transuranic (TRU), compute the sum of the specific activity of the alpha-emitting radionuclides having half-lives greater than 20 years. These radionuclides are identified by footnote b in Table A-2. If the total alpha activity exceeds 100 nanocuries (3,700 becquerels) per gram, the waste is TRU. (DOE M 435.1-1)

For the mass of the waste matrix used in the TRU determination, the following direction will be used.

- The mass of added shielding, the container, and any rigid liners is excluded.
- The mass of stabilization media and similar materials added to meet waste acceptance criteria is used in accordance with DOE G 435.1-1, Chapter III.A.

A1.1.2 Calculation of Plutonium-239 Fissile Gram Equivalents

Fissile gram equivalent (FGE) is defined as the amount of plutonium-239 (in grams) that will produce the equivalent reactivity as another isotope at optimal shape, moderation, and reflection. FGE normally is calculated using the following steps.

1. Multiply the grams of each fissionable isotope by the FGE conversion factor (FGE per gram) in Appendix B, Table B-1, to yield the FGE for the isotope.

$$\text{Isotope mass (grams)} \times \text{isotope conversion factor (FGE per gram)} = \text{Isotope FGE.}$$

2. Sum the FGE for each fissionable isotope to a total FGE for all isotopes. If there is more than one gram of uranium-235, the WSD Project facility criticality safety representative could use an alternate method for determining the FGE for uranium-235 as discussed in Appendix B. Natural uranium (i.e., 0.72 percent uranium-235) and depleted uranium (i.e., <0.72 percent) is normally exempt for criticality purposes at WSD Project TSD units; however, the FGE from uranium-235 is counted for acceptance at the Waste Isolation Pilot Plant (WIPP).

A1.1.3 Calculation of Thermal Power

The thermal power of the waste in a container is calculated from the concentration of radionuclides in the waste and the heat of decay from Table A-1. The thermal power calculation is performed using the following steps.

1. The concentration of each isotope is multiplied by the heat of decay for that isotope from the value in Table A-1, yielding the thermal power for each isotope.

$$\begin{aligned} &\text{Isotope concentration (curies per cubic meter)} \times \text{decay heat (watts/curie)} \\ &= \text{decay heat (watts per cubic meter)} \end{aligned}$$

2. Thermal power is the sum of the thermal power of all isotopes in the waste.

A1.1.4 Category 1 Determination

Classification of waste as Category 1 or greater than Category 1 is a sum-of-fractions calculation, performed using the following steps.

1. The concentration of each isotope (expressed in curies per cubic meter) is divided by its respective Category 1 limit from Table A-2.
2. The category is the sum of the fractions for all isotopes in the waste package.

If the sum of the fractions is less-than-or-equal-to 1, the waste is Category 1. If the sum of fractions exceeds 1, the waste is greater than Category 1, and the Category 3 determination described in A1.5 must be performed to classify the waste package.

A1.1.5 Category 3 Determination

Category 3 determination is performed in the same way as the Category 1 calculation, only using the Category 3 limits from Table A-2 using the following steps.

1. The concentration of each isotope (expressed in curies per cubic meter) is divided by its respective Category 3 limit from Table A-2.
2. The category is the sum of the fractions for all isotopes in the waste.

If the sum of the fractions is less than or equal to 1, the waste is Category 3. If the sum of fractions exceeds 1, the waste is greater than Category 3.

A1.1.6 Mobile Radionuclide Reporting

This is a simple comparison of the concentration of each mobile isotope (hydrogen-3, carbon-14, chlorine-36, selenium-79, molybdenum-93, technetium-99, iodine-129, rhenium-187, total uranium, and neptunium-237) against its respective reporting value from Table A-2.

A1.1.7 Calculating Dose Equivalent Curies

Calculation of dose equivalent curies (DE-Ci) is a method of normalizing the exposure risk of various isotopes. Calculation of the DE-Ci of a waste container is performed using the following steps.

1. Multiply the activity (in curies) of each isotope in a given container by its respective ICRP 71 Correction Factor from Table A-1.
2. The total DE-Ci of the waste package is the sum of the DE-Ci values for all isotopes in the waste multiplied by the assigned “Master Documented Safety Analysis (MDSA) DE-Ci Factor” (default value is 1.0). An MDSA DE-Ci Factor other than 1 may be applied based on the package factors described in MDSA Appendix 3B. To adjust the effective material at risk based on the robustness of the waste packaging and dispersibility of the material form for comparison with facility or container DE-Ci, limits that have been established for standard waste containers.

A1.1.8 Calculating Plutonium-239 Equivalent Curies

The plutonium equivalent curie calculation is required for TRU waste to be shipped to the WIPP. The plutonium equivalent curie calculation is performed as specified in the WIPP waste acceptance criteria (DOE/WIPP-02-3122).

B1.0 APPENDIX B

B1.1 FISSIONABLE MATERIAL CONTENT LIMITS

The following describes the limits for fissionable material content in waste packages or bulk waste sent to treatment, storage, and/or disposal units covered by the criteria provided in this document. Fissionable material inventories for a given container shall be restricted to ensure they do not exceed the applicable fissionable material limit, including measurement uncertainty. For some waste packages, the generator must provide distribution of the fissionable material or moderating materials in the container to determine the applicable specification and whether criticality limits are met. Meeting criticality limits does not assure that the container will be accepted, as Waste Isolation Pilot Plant (WIPP) and disposal limits may be more restrictive.

B1.1.1 Exempt Materials

Waste packages or bulk waste shipments are exempt from criticality safety controls and fissile labeling at all treatment, storage, and/or disposal units if the fissile gram equivalence for the contained fissionable material is less than 1 fissile gram equivalent (FGE). Natural uranium (i.e., 0.72 percent uranium-235) and depleted uranium (i.e., <0.72 percent) is normally exempt for criticality purposes at the treatment, storage, and/or disposal units; however, the FGE from uranium-235 is counted for WIPP acceptance.

B1.1.2 Measurement Uncertainty For Nonexempt Materials

Measured values of operating parameters subject to criticality safety limits (e.g., the mass of a given isotope) shall conservatively account for assessed biases and uncertainties for the measurement methods.

The measurement uncertainty will be accounted for in the following ways.

1. For transuranic waste destined for the Waste Isolation Pilot Plant, the sum of the measured mass and the mass corresponding to the 2 sigma total measurement uncertainty shall be less than the fissile material quantity limits in Table G-2.
2. For measurements of fissionable material under a critical mass limit, where the accuracy of the fissile mass measurement method is controlled to within ± 5 percent at the 95 percent confidence limit, the reported mass may be used as the mass limit control value. If the method's accuracy is outside ± 5 percent (at the 95 percent confidence limit), as it is for certain nondestructive assay methods, then allowance for a potentially higher mass due to inaccuracy shall be accounted for in one of these ways:

- The sum of the measured mass and the mass corresponding to the 2 sigma uncertainty in the measurement method or 1 sigma total measurement uncertainty shall be less than the criticality prevention specification (CPS) mass limit (i.e., the limits of this Appendix).
- The Waste Stabilization and Disposition (WSD) Project criticality safety representative has determined acceptability per HNF-20558. Such exemptions shall be obtained in accordance with Section 1.6 of these acceptance criteria.

B1.1.3 Non-Exempt Materials in Standard Containers

Certain non-exempt materials in standard packaging configurations (per Table B-2) are acceptable at the Low-Level Burial Grounds (LLBG), the Central Waste Complex (CWC), the T Plant Complex, and the Waste Receiving and Processing (WRAP) Facility. The fissionable material limits are expressed in plutonium-239 FGE as defined in HNF-5134, *CSER 00-005, Determination of Fissile Gram Equivalence for Hanford Solid Waste Operations*, and described in Section A1.1.2. Table B-1 is used to determine the total fissile gram equivalence of fissionable material in a waste container by multiplying the gram quantity of each listed isotope by the correction factor and summing the results. Note that when waste contains a significant quantity of non-exempt uranium-235, the FGE calculation will be conservative, as it does not account for the poisoning effect of uranium-238 in the mixture. If a container approaches or exceeds a limit of Table B-2, due in part to the uranium-235 content, the method provided in Section B1.1.6 can be used to lower the contribution of uranium-235 to the total FGE. This will be applied for waste disposal and may be used for waste retrieval operations as needed.

Some of the specific container limits are shown in Table B-2, which addresses the most common containers and CPSs. Additional requirements are detailed in the CPSs. Other container limits or acceptable configurations may be available. Exceptions can be requested as specified in Section 1.6. If a new criticality safety evaluation report (CSER) is required for a new waste stream, the generator will need to provide funding for performing the evaluation.

Note that for the LLBG, containers are also limited to 128.5 FGE per drum equivalent volume and 42.4 FGE per square foot cross sectional area (CPS-SW-008).

Liquids and absorbed liquids with non-exempt quantities of fissionable material must normally be packaged in 3.8 liter (1-gallon) containers or limited to less than 2.2 liters (0.58 gallons). Specific Plutonium Finishing Plant waste streams, however, are allowed for direct disposal into absorbent in 208 liter (55-gallon) drums with 90 mil liners.

B1.1.4 Non-Exempt Materials in Non-Standard Containers or Bulk Waste

Waste packages that have non-exempt quantities of fissionable material but are not in Table B-2 standard containers (e.g., in 114 liter [30-gallon] drums, concrete or wooden boxes, small boxes, ion exchange modules, or bulk waste shipments) may still be received for storage and disposal. Waste packages of this type may be accepted up to a maximum of 128.5 FGE, per drum

equivalent volume and 42.4 FGE per square foot cross sectional area (CPS-SW-008). Other transportation limits might apply to the entire shipment.

B1.1.5 Non-Exempt Quantities of Fissionable Radionuclides in Other Configurations

Limits for configurations other than those shown in Sections B1.1.3 and B1.1.4 may already be available or may be requested as described in Section 1.6. If a new CSER is required for a new waste stream the generator will need to provide funding for performing the evaluation.

B1.1.6 Calculation of Uranium-235 FGE

HNF-5134 provides a detailed method for calculating FGE that takes into account the poisoning effect of uranium-238. The maximum enrichment, or actual distribution for a mixture of enrichments, is required to perform this calculation. If uranium is not a significant factor, FGE may be calculated as shown in Section A1.1.2. The uranium-235 FGE value for the uranium in a waste package is calculated by one of the following methods.

1. FGE for uranium-235 may be calculated using the conversion factor in Table B-1. Uranium-235 also may be excluded in calculating FGE if it is in natural or depleted uranium (less than or equal to 0.72 weight percent uranium-235 in uranium); however, the FGE from uranium-235 is counted for WIPP acceptance. The WSD Project facility criticality safety representative may also exempt homogeneous uranium solutions in solid or liquid form up to 1.0 weight percent enrichment of uranium-235.
2. The FGE for uranium-235 may be conservatively calculated by including all uranium-235 present with no exemptions on a 1 gram = 1 FGE basis. This conservative method of conversion was typically used for older waste packages.
3. If a bounding value or specific distribution is known for the uranium-235 enrichment (e.g., based on analytical data or process knowledge), the facility criticality safety representative may use the alternate FGE method specified below. If the enrichment of a batch of uranium is not known, the enrichment value is treated as 100 percent uranium-235 and method 1 or 2, above, is used. This third method is normally used for waste to be disposed at the LLBG or retrieved from the transuranic (TRU) retrieval trenches, but is not used for WIPP acceptance.

The first two methods above result in over counting the contribution of uranium-235 to the fission process by neglecting the effects of uranium-238 in reducing the neutron population available for fission (i.e., poisoning). These methods are adequate (safe) for accepting waste containers if the amount of uranium-235 is less than the criticality mass limit, but such usage may unnecessarily restrict shipping of containers with greater than 1 gram of uranium-235. Uranium FGE may be determined by summing the FGEs of uranium-235 at each distinct homogeneous enrichment. Each FGE is the ratio of the uranium mass at an enrichment divided by the minimum critical mass at that enrichment from Table B-3, multiplied by the

minimum critical mass for plutonium-239 (531 FGE). If the mass at each enrichment is not known or it is desirable to group several enrichments together, the highest enrichment is to be used for the entire mass of that group. The details of this calculation are specified below.

Calculate a fraction for each mass **A** (grams) of uranium-235 with a distinct enrichment **B**, determine the uranium-235 mass limit **D** for the enrichment **C** from Table B-3 which is greater than or equal to enrichment **B**. Calculate the sum-of-the-fractions using these fractions as follows.

$$\text{Uranium FGE} = \text{Sum of } (\mathbf{A} \div \mathbf{D}) \text{ for each distinct enrichment } (\mathbf{B}) \times 531$$

Table B-2. Summary of Fissile Material Limits for Standard Waste Containers.

| Container | Additional Container or Content Specifications | Maximum FGE without handling restrictions (CPS-SWOC-001) | Maximum FGE with handling restrictions (CPS-SWOC-001) | Maximum WIPP FGE |
|---|--|--|---|------------------|
| 208 liter (55-gallon) drum or larger | ≤ 136 kg (300 lb) GW, < 9 kg (20 lb) graphite | 204 | 405 | 200 |
| | > 136 kg (300 lb) to ≤ 272 kg (600 lb) GW, < 9 kg (20 lb) graphite | 181 | 405 | 200 |
| | > 272 kg (600 lb) GW | 125 | 315 | 200 |
| | Liquid Organic Lab Pack | 100 | 100 | Not acceptable |
| WIPP SWB and other boxes (only SWBs are allowed for WIPP) | Unrestricted H/X | 50 | 250 | 325-380 |
| | SWB as drum overpack | 50 | 500 | 325-380 |
| | Concentrated material, ≤ 15 FGE/ft ² (e.g., VIPAC fuel pins) | 250 | 250 | 325-380 |
| | Cleaned and drained equipment and associated incidental fissile waste; and/or HEPA filters ≤ 10 FGE/ft ³ | 500 | 1000 | 325-380 |
| TDOP | Up to 10 drums | 325 | 325 | 325 |

NOTE 1: All FGE limits include uncertainty (2 TMU for WIPP; 1 TMU or 2σ for SWOC).NOTE 2: WIPP acceptance of SWBs over 325 FGE is dependent on the ²⁴⁰Pu content.

Exceptions for fissile containers:

1. Drums over 200 FGE may be acceptable at WIPP when overpacked in an SWB or TDOP.
2. Non-steel drums are allowed with WSD CSR concurrence, but handling restrictions may be required.
3. Containers smaller than a 208 liter (55-gallon) drum may be allowed with WSD CSR concurrence, but handling restrictions may be required.
4. Fissile boxes smaller than 1.5 m x 1.2 m x 0.9 m (5 ft x 4 ft x 3 ft) (L x W x H) may be allowed with WSD CSR concurrence.
5. Over 2.2 liters (0.58 gallon) liquid in a container may be allowed with WSD CSR concurrence, but FGE limits are reduced and handling restrictions may be required.
6. Other containers may be acceptable at SWOC based on specific CSERs.
7. SWOC normally excludes depleted or natural uranium from FGE calculations—WIPP does not.
8. Additional process controls may be required by the applicable CPSs.
9. Additional disposal requirements apply (CPS-SW-008) (see Sections B1.1.13 and B1.1.14).

CPS = criticality prevention specification
 CSER = criticality safety evaluation report
 CSR = criticality safety representative
 FGE = fissile gram equivalent
 GW = gross weight
 HEPA = high-efficiency particulate air
 H/X = Hydrogen to fissile atom ratio

SWB = standard waste box
 SWOC = Solid Waste Operations Complex
 TDOP = ten drum overpack
 TMU = total measurement uncertainty
 VIPAC = vibratory compaction fuel pins
 WIPP = Waste Isolation Pilot Plant
 WSD = Waste Stabilization and Disposition

Table B-3. Minimum Critical Mass and Maximum Uranium-235 for Various Enrichments.

| (C) ^a Maximum Enrichment (Weight Percent U-235) | Minimum Critical Mass for U (kilogram) (U-235 Plus U-238) at This Maximum Enrichment | (D) ^a Maximum U-235 (gram) at This Enrichment |
|--|--|---|
| 0.72 | Unlimited | Unlimited |
| 0.80 | 10,000 | 80,000 |
| 0.85 | 7,000 | 60,000 |
| 0.90 | 3,800 | 35,000 |
| 0.95 | 2,600 | 25,000 |

C1.0 APPENDIX C

C1.1 LABELING OF WASTE CONTAINERS

Containers sent to Hanford Site treatment, storage, and/or disposal units must be labeled for identification and to communicate information needed for proper waste management. Table C-1 shows the standard labeling required on containerized waste. The following sections provide general requirements for labels and markings.

C1.1.1 Bar Code

Each container shall be labeled with a bar code showing the unique container identification number (CIN). Bar-coded CINs will be assigned as follows.

- For containers purchased through the Hanford Site procurement system, the bar code will be attached to the containers when the containers are received at the Central Stores warehouse. The CIN is a unique seven-digit number beginning with the last two digits of the year the container was purchased. (Valid up to the year 2000.)
- For containers not purchased through the Hanford Site procurement system, Hanford Site generators will assign a CIN. The CIN must be a unique number. The suggested format to ensure that the CIN is unique is: "Facility ID-Year-Sequential #," where the Facility ID is the generating facility's unique 4-character (letter and/or number) identifier, "Year" is the last two digits of the year the CIN was assigned, and "Sequential #" is the generator's sequential numbering of containers for that year.
- For offsite generators, a bar code will be attached when the container is received on the Hanford Site. The CIN will be the unique container identification number provided by the waste generator. (NOTE: Offsite generators should contact the Waste Stabilization and Disposition [WSD] Project acceptance organization for guidance on assigning a unique identification number.)

C1.1.2 Durability

Labels and markings must be durable, fade-resistant, water-resistant paints, vinyl stickers, or another system that is sufficiently durable to remain intact and legible during management of the waste before disposal. For waste placed into storage, labels must remain intact and legible for 20 years.

C1.1.3 Placement of Labels

Labels and markings shall be positioned so that all required information is visible on the same side of the container as the bar code. If drums are destined for storage, the bolt on the drum ring must be placed at approximately a 90-degree angle to the drum labels. If drums are palletized, the drums must be oriented on the pallet such that a complete set of labels is visible.

C1.1.4 Size of Labels

Standard labels defined by regulations (e.g., U.S. Department of Transportation [DOT] label, hazardous waste label, polychlorinated biphenyl [PCB] label, asbestos label) should be the conventional size specified by the regulations. Characters on other labels (e.g., gross weight, major risk label) must be a minimum of 2.54 centimeters (1 inch) high or as specified by the regulations.

C1.1.5 Labeling Inner Containers in Lab Packs

Each inner container in a lab pack must be labeled with an identification number or waste name cross-referenced against the contents inventory sheet. These labels must be sufficiently durable to remain legible for 20 years.

Table C-1. Required Labeling for Waste Containers.^d

| Label | When Required | Location on Drum | Location on Box |
|---|--|------------------------|------------------------|
| Bar code with container identification number | All containers | Bottom third of drum | Short side of box |
| Gross weight in kilograms (Kilogram units must appear on label) | All containers | Same side as bar code | Same side as bar code |
| Applicable DOT labeling | All containers | As specified in 49 CFR | As specified in 49 CFR |
| Hazardous waste label | Dangerous and mixed waste containers | Same side as bar code | Same side as bar code |
| Major risk label(s) ^a | Dangerous and mixed waste containers | Same side as bar code | Same side as bar code |
| PCB label ^b | Waste that is regulated for PCB content under 40 CFR 761 | Same side as bar code | Same side as bar code |
| Asbestos label | As required per 40 CFR 61 Subpart M | Same side as bar code | Same side as bar code |
| SWITS-generated fissile label (printed with a barcode printer) and fissile trefoil label (or symbol) ^c | Containers with 1 fissile gram equivalent or more fissionable material | Same side as bar code | Same side as bar code |

^aRefer to Table C-2 for major risk labeling of dangerous, mixed and TRU-mixed waste.

^bLabel in accordance with 40 CFR 761.40 and 40 CFR 761.45. The label placed on containers holding PCB items must include the date the item was removed from service. For PCB articles and containers, the label must include the date the waste was placed into storage, including 30-day temporary storage areas.

^cThese labels might conflict with the DOT fissile label; for shipments of waste from offsite and many onsite generators, these labels should be placed on the containers at the time the waste arrives on the Hanford Site or at the receiving facility.

^dFor packages shipped within a Special Packaging Zone as allowed by DOE/RL-2001-36, the minimum marking and labeling requirements are the bar code with container identification number and gross weight in kilograms.

DOT = U.S. Department of Transportation

PCB = polychlorinated biphenyl

TRU = transuranic

40 CFR 61, "National Emission Standards for Hazardous Air Pollutants," *Code of Federal Regulations*, as amended.

40 CFR 761, "Polychlorinated Biphenyls (PCBs) Manufacturing, Processing, Distribution in Commerce, and Use Prohibitions," *Code of Federal Regulations*, as amended.

49 CFR, "Transportation," *Code of Federal Regulations*, as amended.

DOE/RL-2001-36, 2003, *Hanford Sitewide Transportation Safety Document*, U.S. Department of Energy, Richland Operations Office, Richland, Washington. (Use most current version.)

Table C-2. Selection of Major Risk Labeling.

| Hazard or Risk | Acceptable Labels and Markings |
|--|---|
| Flammable liquid | DOT Class 3 label (Flammable Liquid) FLAMMABLE LIQUID COMBUSTIBLE LIQUID |
| Flammable solid | DOT Division 4.1 label (Flammable Solid) FLAMMABLE SOLID |
| Water-reactive | DOT Division 4.3 label (Dangerous When Wet) DANGEROUS WHEN WET WATER-REACTIVE |
| Oxidizer | DOT Division 5.1 label (Oxidizer) OXIDIZER |
| Organic peroxide | DOT Division 5.2 label (Organic Peroxide) ORGANIC PEROXIDE |
| Poison or Toxic | DOT Division 6.1 label (Poison) or (Inhalation Hazard) POISON or TOXIC POISON—INHALATION HAZARD or TOXIC—INHALATION HAZARD |
| Corrosive Liquid or Corrosive Solid | DOT Class 8 label (Corrosive) CORROSIVE |
| Hazardous Wastes—DOT Class 9 only | DOT Class 9 label (Miscellaneous) and “Hazardous Waste” or “Dangerous Waste” marking |
| WA State Only Dangerous Wastes—Non DOT | “Hazardous Waste” or “Dangerous Waste” marking |

NOTE: Choose the label or marking, or combination of labels or markings that most clearly communicates the major risk(s) associated with the waste. Markings in Table C-2 must be applied for dangerous waste major risk(s) regardless of the DOT radioactive labeling status. DOT labels must be used when required by the DOT.

DOT = U.S. Department of Transportation

Prior to DOT transportation and during dangerous waste accumulation in Washington State, DOT markings can be used instead of DOT labels to communicate dangerous waste major risk(s), (e.g., if the major risk of a dangerous waste is flammability, the container may be marked “Flammable” as opposed to being labeled with the Class 3 Flammable label). However, at the point of transportation, the waste must be labeled with the applicable DOT hazard class label. Major risk markings requirements are as follows (HNF-PRO-15333).

- State-only/Non-DOT dangerous waste: The words “hazardous waste” or “dangerous waste” are sufficient.
- State-only/DOT and federal hazardous waste: The words “hazardous waste” or “dangerous waste” and the DOT hazard class label or mark are sufficient.

D1.0 APPENDIX D

D1.1 SELECTION OF COMPATIBLE CONTAINERS, COATINGS, AND LINERS

WAC 173-303-630 (4) requires that containers used for storage of dangerous waste be made of, or lined with, materials that are compatible with the waste and will not react with the waste such that the ability of the container to contain the waste is not impaired. A variety of factors affect the compatibility of a container/liner combination, including the properties of chemical constituents in the waste, the physical form of the waste (e.g., free liquid, sorbed liquid, dry waste), and the anticipated length of storage.

The compatibility of the container/liner and the waste is determined using chemical compatibility charts, manufacturer's compatibility data, and/or other applicable data. Any combination of container(s) and/or liner(s) can be used that is compatible with the waste.

Hanford Site procurement specifications for metal drums (HNF-7403) and boxes (HNF-7656) identify several options for container coatings, with varying degrees of chemical resistance. The document WHC-SD-TP-ES-002, *Justification for Packaging Acceptance Criteria* describes a set of standard packages from the Hanford Site that generally will be compatible with the types of waste generated on the Hanford Site. Table D-1 provides baseline coating and liner combinations for metal containers based on WHC-SD-TP-ES-002. These container/liner combinations generally provide a compatible container, although compatibility data must demonstrate that the container is compatible with the waste. (NOTE: The Hanford Site specifications and Table D-1 are provided for information purposes only. It is not necessary to select packaging according to Hanford Site specifications.)

Table D-1. Standard Container/Liner Combinations.

| WSRd Series | SubGroup ^a | Minimum Coatings/Liners ^b |
|--|--|--------------------------------------|
| 100—Low-level waste | Low-level dry waste for disposal | LPC/no liner |
| | Low-level absorbed liquids | LPC/10 mil liner |
| 200—TRU waste | Dry debris and soil | LPC/10 mil liner MPC/no liner |
| | Sorbed or solidified corrosive (acid or caustic) liquids | LPC/90 mil liner HPC/no liner |
| | Sorbed or solidified noncorrosive liquids, sludges, and wet soil | MPC/10 mil liner LPC/90 mil liner |
| 400—Mixed waste overpacked and lab packed liquids | Organic liquids (noncorrosive) | MPC/10 mil liner LPC/90 mil liner |
| | Corrosive (acidic or caustic) or oxidizing liquids | HPC/no liner LPC/90 mil liner |
| | Other noncorrosive waste | MPC/10 mil liner LPC/90 mil liner |
| 500—Mixed waste solids, sorbed liquids, and soils | Sorbed organic liquids or sludges (noncorrosive) | MPC/10 mil liner LPC/90 mil liner |
| | Corrosive (acidic or caustic) or oxidizing waste | HPC/no liner LPC/90 mil liner |
| | Noncorrosive sorbed liquid, sludges, or wet soils | MPC/10 mil liner LPC/90 mil liner |
| | Noncorrosive dry solids or dry soils | MPC/no liner LPC/10 mil liner |
| 600—Mixed debris waste | Corrosive (acidic or caustic) or oxidizing debris | HPC/no liner LPC/90 mil liner |
| | Other noncorrosive debris | MPC/no liner LPC/10 mil liner |
| 800—Mixed waste with specific treatment standards | Lead solids, beryllium powder | LPC/no liner |
| | Elemental mercury | LPC/10 mil liner |
| | Batteries containing acids or caustics | HPC/no liner LPC/90 mil liner |
| | Other | Case-by-case evaluation |
| 900—State-only mixed waste and LDR-compliant mixed waste | Solid corrosive waste | HPC/no liner LPC/90 mil liner |
| | Other | MPC/no liner LPC/10 mil liner |

^aFor mixed hazards, the most protective combination of coatings/liners should be chosen.

^bContainer coating/liner abbreviations are as follows.

10-mil liner—10 mil or thicker nylon-reinforced polyethylene liner.

90-mil liner—90 mil or thicker high-density polyethylene rigid liner.

HPC = high performance coating.

LDR = land disposal restrictions.

LPC = low performance coating.

MPC = medium performance coating.

TRU = transuranic.

WSRd = waste specification record.

E1.0 APPENDIX E

E1.1 SELECTION AND USE OF VOID FILLERS, SORBENTS AND STABILIZING MATERIALS

A variety of materials can be added as void filler to meet the void space requirements of Chapters 3.0 and 4.0.

Sorbents and stabilizing materials can be used to meet free liquid requirements or to provide a safer waste form for handling and storage. All sorbents and stabilizing materials must be nonhazardous, compatible with the waste being sorbed or stabilized, and nonbiodegradable as defined in Title 40 *Code of Federal Regulations* (CFR) 264.314(e). Table E-1 lists the general types of sorbents and stabilizing materials that can be used for major Hanford Site waste streams. Specific products used must meet the definitions of Section E1.1 that have been listed on an approved Waste Profile Sheet.

Note that use of these materials to meet radiological stabilization (i.e., to meet Category 3 or mobile radionuclide stabilization requirements) or *Resource Conservation and Recovery Act of 1976* land disposal restrictions treatment standards is not addressed in this appendix. More specific evaluation must be performed as specified previously in this document to demonstrate radiological stabilization or land disposal restrictions compliance.

E1.1.1 General Types of Sorbents and Stabilizing Materials Potentially Allowed

The general types of sorbents and stabilizing materials potentially allowed include the following.

- Inorganic mineral sorbents including aluminosilicates, clays, vermiculite, zeolites, lime, silica, diatomaceous earth, perlite, fly ash and other inorganic materials used for absorption.
- High molecular weight synthetic polymers (polymer sorbents) including polyethylene, high-density polyethylene, polypropylene, polyacrylate, and other synthetic polymers. This excludes polymers derived from biological material (e.g., cellulose-based materials), and polymers specifically designed to be degradable.
- Stabilizing materials including concrete, portland cement, lime/pozzolans, and a variety of other inorganic materials.

NOTE: Selection of specific materials must be in accordance with Section E1.1.2.

Specialty stabilization agents for organic liquids include certain products that stabilize organic liquids. These products chemically react with organic liquids to prevent their release in the disposal environment.

E1.1.2 Selection and Use of Sorbents and Stabilizing Materials

Selection and use of a specific product for sorption of a given waste must address the following.

- Determine from Table E-1 what general classes of materials can be used and the conditions for use. The allowable types of sorbents for various waste streams are based on the anticipated treatment/disposal methods.
- Select a product that is appropriate for the material to be treated. Generators can request approval of products in the waste stream profile sheet by providing data to support the intended use. Approval of the profile constitutes approval of the product.
- Obtain manufacturer's instructions and limitations for use of the product. It is critical to use sorbents and stabilizing materials in accordance with the manufacturer's instructions. Information required includes the following.
 - Compatibility of the sorbent or stabilizing material with the waste.
 - The recommended ratio of sorbent to waste for the liquid being sorbed.
 - For stabilizing materials, the exact ratio of liquid to stabilizing materials and methods of mixing.

It might be necessary to run a test of the waste or a surrogate to ensure that the product works adequately with the waste requiring sorption or stabilization.

E1.1.3 Hanford Site Requirements for Use of Sorbents

Sorbents used for Hanford Site treatment, storage, and/or disposal units must be used in sufficient quantity to meet the following requirement.

Use twice the minimum amount of sorbent. Based on data from the manufacturer or testing, the minimum ratio of sorbent to liquid is determined. For all Hanford Site applications, a minimum of twice the minimum amount of sorbent shall be used.

Table E-1. Sorbent Selection Based on Waste Specification Records.

| WSRd Series | Subgroup | Allowable Sorbents/Stabilizing Materials |
|--|---|---|
| 100—Low-level waste | Low-level liquids for disposal | Mineral sorbents Polymer sorbents Stabilizing materials |
| | Low-level organic liquids and chelating agents for disposal | Stabilizing materials |
| 200—TRU waste | TRU-mixed waste | Mineral sorbents Polymer sorbents Stabilizing materials |
| | TRU waste (not mixed) | Mineral sorbents Polymer sorbents Stabilizing materials |
| 400—Mixed waste overpacked and lab packed liquids ^a | All types | Mineral sorbents Polymer sorbents |
| 500—Mixed waste solids, sorbed liquids and soils | Non-thermal treatment WSRds (520 series) | Mineral sorbents Polymer sorbents |
| | Thermal treatment WSRds (500 series) | Mineral sorbents Polymer sorbents |
| 600—Mixed debris waste | Thermal treatment WSRds (620 series) | Mineral sorbents Polymer sorbents |
| | Non-thermal treatment WSRds (640 series) | Mineral sorbents Polymer sorbents |
| 800—Other mixed waste with specific treatment standards | All types | Polymer sorbents (or as specified in waste stream profile) |
| 900—State-only mixed waste and LDR-compliant mixed waste | Thermal treatment WSRds (920 series) | Mineral sorbents Polymer sorbents |
| | Other WSRds | Mineral sorbents Polymer sorbents |

^aSorbent for lab packs is placed around containers, not mixed with liquids.

LDR = land disposal restrictions.

TRU = transuranic.

WSRd = waste specification record.

F1.0 APPENDIX F

F1.1 RADIOLOGICAL RELEASE OF WASTE

Appendix F has been retired. Radiological release information is reflected in these two documents:

HNF-PRO-20377, *Radiological Release Surveys for Material with Potential Volumetric Contamination*, Fluor Hanford Inc., Richland, Washington.

HNF-13536, 2005, *PHMC Radiological Control Procedures*, Rev. 16, Section 4.1.1, “Release Surveys for Material and Equipment,” Fluor Hanford, Inc., Richland, Washington. (Use most current version.)

G1.0 APPENDIX G

G1.1 CONTACT-HANDLED TRANSURANIC WASTE CERTIFICATION REQUIREMENTS

As a generator of transuranic (TRU) and TRU mixed waste destined for disposal at the Waste Isolation Pilot Plant (WIPP), the Hanford Site TRU Program must ensure that its contact-handled (CH) TRU waste meets the requirements of U.S. Department of Energy (DOE) Order 435.1, *Radioactive Waste Management*, and DOE/WIPP-02-3122. DOE/WIPP-02-3122 establishes the specific physical, chemical, radiological, and packaging criteria for acceptance of defense TRU waste shipments at the WIPP as required depending upon waste material form and packaging configurations.

In addition to meeting the general requirements of this document, the following are the specific TRU waste acceptance criteria.

G1.1.1 Remote-Handled Transuranic Criteria

See Appendix I

G1.1.2 Contact-Handled Transuranic Criteria

1. Waste must be segregated by waste specification record, including segregation of defense from non-defense waste. Non-defense waste is prohibited at the WIPP.

Defense waste is waste generated, in whole or in part, by the Secretary of Energy (and predecessor agencies) while carrying out any of these functions: naval reactors development; weapons activities, including defense inertial confinement fusion; verification and control technology; defense nuclear material production; defense nuclear waste and materials by-product management; defense nuclear materials security investigations; and defense research and development.

The generator must supply sufficient information for the TRU Program to prepare and document an appropriate defense determination. Final approval of the defense determination will be made by U.S. Department of Energy, Richland Operations Office (RL) technical, RL Chief Counsel, RL TRU Project Director, Carlsbad Field Office (CBFO) technical, CBFO Chief Counsel, and (if necessary) DOE Headquarters (HQ) General Counsel.

2. Waste must meet all requirements in Table G-1 through Table G-5 except as allowed with profile sheet approval. The Hanford TRU Program may determine additional requirements for specific TRU waste are necessary, beyond those listed in Table G-1 through Table G-5.
3. Waste will be characterized and certified for shipment to WIPP under the Hanford TRU Program. Generators are not responsible for certification of TRU waste; however, generators

are responsible for providing TRU waste that is certifiable. Generator-supplied documentation demonstrating compliance with the requirements in Table G-1 through Table G-5 will ensure the TRU waste is certifiable.

4. Newly generated waste may require packaging using the visual examination technique. This requirement, if applicable, will be communicated to the generator as a waste stream profile condition of approval. Waste Services personnel are available to conduct visual examinations at the generator location.
5. Newly generated waste may require that the Hanford TRU Program obtain WIPP certification of the nondestructive assay equipment used to quantify the radiological properties. This requirement, if applicable, will be communicated to the generator as a waste stream profile condition of approval.
6. Acceptable Knowledge data must be provided through use of a waste stream profile sheet from the *Hanford Site Solid Waste Acceptance Program* Internet web site. The profile sheet is located at <http://www.hanford.gov/wastemgt/wac/>.
7. Packaging requirements will be established by the Hanford TRU Program and communicated to the generator as a waste stream profile condition of approval. Generators must obtain waste stream profile approval prior to generating and/or packaging their contact-handled transuranic (CH TRU) waste.

Generators unable to meet the above CH TRU criteria may request an exception to the waste acceptance criteria per Section 1.6 of this document.

II.0 APPENDIX I

II.1 REMOTE-HANDLED TRANSURANIC WASTE ACCEPTANCE CRITERIA

As a generator of remote-handled (RH) transuranic (TRU) waste and remote-handled transuranic (RH TRU) mixed waste destined for disposal at the Waste Isolation Pilot Plant (WIPP), the Hanford Site must ensure that RH TRU waste meets the requirements of U.S. Department of Energy (DOE) Order 435.1, *Radioactive Waste Management*, and DOE/WIPP 02-3214, *RH TRU Waste Characterization Program Implementation Plan (WCPIP)*. DOE/WIPP 02-3214 establishes the requirements for the characterization and certification of RH TRU to meet the requirements of the U.S. Environmental Protection Agency (EPA) for disposal of RH TRU waste at WIPP. Additional and/or different characterization requirements may be in place by the time the Hanford RH-TRU Program is certified. RH TRU waste may be transported to WIPP in either of two U.S. Nuclear Regulatory Commission (NRC)-approved shipping casks, the RH TRU 72-B or the CNS 10-160B. The waste characterization and packaging requirements for these casks are contained in the *Safety Analysis Report for the RH-TRU 72-B Shipping Package* (NRC 2002) and the *Safety Analysis Report for the CNS 10-160B Shipping Package* (NRC 2005) respectively.

RH TRU waste may be packaged in 114 or 208 liter (30- or 55-gallon) drums for shipment to the appropriate facility within the Solid Waste Operations Complex (SWOC). If the waste is to be transported to WIPP in the RH-72B shipping cask, the drums will be overpacked into RH-72B canisters prior to shipment to WIPP. Waste generators may also directly load RH-72B canisters prior to shipment to a SWOC facility. Newly generated RH TRU waste must be visually examined by Waste Services personnel during packaging.

At this time, the requirements for characterizing the hazardous waste component of RH TRU waste have not been finalized. Until the WIPP RH TRU Hazardous Waste Facility Permit modification has been approved by the New Mexico Environment Department, there remains significant uncertainty regarding these requirements. RH TRU waste generators are advised to characterize the hazardous waste component of their RH TRU waste in accordance with the established Acceptable Knowledge (AK) requirements that are applicable to contact-handled (CH) TRU waste with the exception that headspace gas and solids sampling and analysis are not applicable. In addition, all the requirements for packaging and shipping in the RH TRU 72B cask must be met before the RH TRU waste can be accepted into a SWOC facility.

II.2 REMOTE-HANDLED TRANSURANIC WASTE CRITERIA

1. Waste must be segregated by waste specification record, including segregation of defense from non-defense waste. Non-defense waste is prohibited for shipment to WIPP, but may be shipped to a SWOC facility for storage.

Defense waste is waste generated, in whole or in part, by the Secretary of Energy (and predecessor agencies) performed in whole or in part in carrying out any of the following

functions: naval reactors development; weapons activities, including defense inertial confinement fusion; verification and control technology; defense nuclear material production; defense nuclear waste and materials by-product management; defense nuclear materials security investigations; and defense research and development.

The generator must supply sufficient information for the TRU Program to prepare and document an appropriate defense determination. Final approval of the defense determination will be made by U.S. Department of Energy, Richland Operations Office (RL) technical, RL Chief Counsel, RL TRU Project Director, Carlsbad Field Office (CBFO) technical, CBFO Chief Counsel, and (if necessary) DOE Headquarters (HQ) General Counsel.

2. Waste must meet all requirements of Table I-1 through Table I-5, except as allowed with profile sheet approval. The Hanford TRU Program may determine additional requirements are necessary for specific TRU waste, beyond those listed in Table I-1 through Table I-5.
3. Waste will be characterized and certified for shipment to WIPP under the Hanford TRU Program. Generators are not responsible for certification of TRU waste; however, they are responsible for providing TRU waste that is certifiable. Generator-supplied documentation demonstrating compliance with the requirements in Table I-1 through Table I-5 will ensure the TRU waste is certifiable.
4. Newly generated waste must undergo visual examination by Waste Services at the time of packaging and may require sampling to verify the radioisotopic properties of the waste. It is recommended that packaging operations be recorded on video/audio media. If the waste generator does not propose to record the packaging on video/audio media, prior approval is required by Waste Services.
5. Retrievably stored RH TRU waste, i.e., waste that is already packaged, may be shipped to a SWOC facility. The generator must provide AK information related to the physical form, originating process, and radioactive contents of the waste.
6. Acceptable Knowledge data must be provided through the use of a waste profile sheet from the *Hanford Site Solid Waste Acceptance Program* Internet web site. The profile sheet is located at <http://www.hanford.gov/wastemgt/wac/>
7. Packaging requirements will be established by the Hanford TRU Program and communicated to the generator as a waste stream profile condition of approval. Generators must obtain waste stream profile approval prior to generating and/or packaging their RH TRU waste. The RH TRU 72-B is the preferred method of shipment to WIPP and Table I-1 through Table I-5 are based on shipping using the RH TRU 72-B. Generators packaging waste for shipment in the CNS 10-160B must consult with the TRU Program for packaging guidance.
8. Generators unable to meet the above RH TRU criteria may request an exception to the waste acceptance criteria per Section 1.6 of this document.

Table I-2. Radiological Properties. (2 sheets total)

| Waste Attribute | Waste Acceptance Criteria | Compliance Method |
|--|---|---|
| Radionuclide Composition | <p>Information on radionuclide composition, with emphasis on the activities and masses of ^{241}Am, ^{238}Pu, ^{239}Pu, ^{240}Pu, ^{242}Pu, ^{233}U, ^{234}U, ^{238}U, ^{90}Sr, and ^{137}Cs.</p> <p>The total activity shall not exceed 82.5 Dose Equivalent Curies per container for acceptance at a SWOC facilities.</p> <p>Note: For WIPP acceptance the maximum activity level may not exceed 23 curies per liter (averaged over the volume of the RH TRU canister).</p> | Acceptable Knowledge (AK) documentation, records of radioassay, dose-to-curie conversion, and/or radiochemistry as required by DOE/WIPP 02-3214. |
| Fissile Material Quantity (Pu-239 fissile gram equivalent [FGE]) | <p>FGE plus the error shall be <200 g/RH TRU waste container.</p> <p>Note: The <200g/RH TRU waste container limit is driven by the SWOC authorization basis. Higher FGE limits, up to 325 g/RH waste container, will be considered on a case-by-case basis. Contact Waste Services for guidance.</p> <p>Note: For drums that will later be overpacked into RH-72B canisters for shipment to WIPP, there are specific FGE limits that apply. Contact Waste Services prior to packaging newly generated RH TRU waste for guidance.</p> | Records of radioassay, dose-to-curie conversion, radiochemistry, and/or AK documentation. |
| TRU Alpha Activity Concentration | The RH TRU canister shall contain more than 100 nCi/g of alpha-emitting TRU isotopes with half-lives greater than 20 years. | Records of radioassay, dose-to-curie conversion, radiochemistry, and/or AK documentation. Records of calculations demonstrating compliance with DOE/WIPP 02-3214. |

Table I-2. Radiological Properties. (2 sheets total)

| Waste Attribute | Waste Acceptance Criteria | Compliance Method |
|---------------------|---|---|
| Radiation Dose Rate | <p>The external radiation dose equivalent rate of individual payload containers shall be greater than or equal to 200 mrem/hr and less than or equal to 1000 rem/hr at the surface of the WIPP certified payload container.</p> <p>Note: No more than five percent by volume of the RH TRU waste received at the WIPP may have a surface dose rate in excess of 100 rem/hr. Waste generators must coordinate planning with the Hanford TRU Project Group if they will generate RH TRU waste with dose rates greater than 100 rem/hr for approval on a case-by-case basis.</p> <p>For waste containers that contain shielding, e.g., lead lined drums, the generator must provide both the actual dose rate and the calculated dose rate if the shielding was not present.</p> <p>Note: For storage at SWOC facilities, waste containers must be shielded to less than 200 mrem at contact. This may be accomplished through the use of shielded overpack containers. Contact Waste Services for guidance.</p> | Records of radiation dose surveys. |
| Decay Heat | ≤Limit established per waste stream profile. | Compliance will be per direction in the waste stream profile and will be based on generator-supplied isotopic and loading data. |

DOE/WIPP-02-3214, 2003, *RH TRU Waste Characterization Program Implementation Plan (WCPIP)*, U.S. Department of Energy, Carlsbad Area Office, Carlsbad, New Mexico. (Use most current version.)

AK = Acceptable Knowledge.

FGE = Fissile Gram Equivalent.

RH TRU = Remote-Handled Transuranic.

SAR = safety analysis report.

WIPP = Waste Isolation Pilot Plant.

Table I-3. Physical Properties.

| Waste Attribute | Waste Acceptance Criteria | Compliance Method |
|-------------------|--|---|
| Liquids | <p>Waste shall contain as little residual liquid as is reasonably achievable by pouring, pumping and/or aspirating, and internal containers shall contain less than 1 inch or 2.5 centimeters of liquid in the bottom of the container.</p> <p>Total residual liquid in any RH TRU waste container may not exceed 1 percent by volume of the waste container.</p> <p>RH TRU waste with EPA Code U134 (hydrofluoric acid) waste shall have no detectable liquid.</p> <p>Residual liquids containing PCBs are prohibited..</p> | AK documentation, records of radiography, and/or visual examination. ^a |
| Sealed Containers | Sealed containers greater than 4 liters in size are prohibited, except for metal containers packaging solid inorganic waste; this packaging configuration does not generate any flammable gas. | AK documentation, records of radiography, and/or visual examination. ^a |

^aNewly Generated RH TRU waste must be visually examined by Waste Services personnel during packaging.
Retrievably stored RH TRU waste must have records (e.g., visual examination data forms, packaging logs, loading sheets, or contents inventory sheets) available that demonstrate the attribute has been met.

AK = Acceptable Knowledge

CPR = cellulose, plastics, and rubber

PCB = polychlorinated biphenyls

TRU = Transuranic

WIPP = Waste Isolation Pilot Plant

Table I-4. Chemical Properties.

| Waste Attribute | Waste Acceptance Criteria | Compliance Methods |
|--------------------------------------|---|---|
| Pyrophoric Materials | <1 percent (by weight) pyrophoric radionuclides No nonradionuclide pyrophoric materials | AK documentation, Records of radiography and/or visual examination. ^a |
| Hazardous Waste | Limited to EPA hazardous waste numbers identified as allowable in the WIPP Hazardous Waste Facility Permit and all Washington State waste codes. No hazardous wastes not occurring as co-contaminants with TRU mixed wastes (non-mixed hazardous wastes) | AK documentation showing the waste contains no EPA codes other than those listed in Table I-6 |
| Chemical Compatibility | No wastes incompatible with backfill, seal and panel closures materials, container and packaging materials, shipping container materials, or other wastes. | AK documentation and/or records of verification by visual examination or radiography ³ that the waste meets the assigned waste stream description in the waste profile. |
| Explosives or Compressed Gasses | No wastes containing explosives or compressed gases. | AK documentation with records of verification through radiography or visual examination. ^a Information from the generator must include the earliest date of waste generation (i.e., the date of removal from service for disposal), the estimated weight of PCBs in kilograms, and a description of the type of PCB waste (e.g., PCB remediation waste, PCB bulk product waste, etc.). |
| Polychlorinated biphenyls | PCBs in any concentration are allowed, but there can be no free flowing liquids in PCB waste. | AK documentation with verification through radiography or visual examination. ^a |
| Reactives, Corrosives, or Ignitables | No wastes exhibiting the characteristic of ignitability, corrosivity, or reactivity (EPA Hazardous Waste Numbers of D001, D002, or D003) | AK documentation with verification through radiography or visual examination. ^a |

^aNewly Generated RH TRU waste must be visually examined by Waste Services personnel during packaging. Retrievably stored RH TRU waste must have records (e.g., visual examination data forms, packaging logs, loading sheets, or contents inventory sheets) available that demonstrate the attribute has been met.
